RADIATION SAFETY GUIDE

SIXTH EDITION
NOVEMBER 2008

Approved By:

Celine Gelinas, Ph.D.
Associate Dean for Research

Beatrice Haimovich, Ph.D.
Chair, Laboratory Safety Committee

Patrick J. McDermott, MS, CHP
Radiation Safety Officer

Mark D. McLane, Director
Rutgers Environmental Health & Safety

Prepared By:

Deborah Hrabinski
Health & Safety Specialist II
I. INTRODUCTION AND ALARA POLICY STATEMENT

II. PROGRAM MANAGEMENT
   A. Radiation Safety Committee
   B. Radiation Safety Officer Responsibilities
   C. Rutgers Environmental Health & Safety Services
   D. Enforcement Policy

III. AUTHORIZATION TO USE RADIOACTIVE MATERIALS
   A. Minimum Requirements, Application and Approval
   B. Authoree Responsibilities
   C. Permit Amendments
      1. Human Use
      2. Animal Research
      3. Field Research
      4. Gamma Irradiators
   D. Permit Expiration and Renewal
   E. Posting Requirements
   F. Termination and Reactivation
   G. Radiation Worker Responsibilities
   H. Policy for Minors Working in Laboratories

IV. TRAINING
   A. Initial Radiation Safety Training
   B. Annual Refresher Training
   C. Lab Specific Training

V. ORDERING, RECEIPT AND TRANSFER OF LICENSED MATERIALS
   A. Ordering Radioactive Materials
   B. Receipt of Packages Containing Radioactive Materials
   C. Transfer of Radioactive Materials
   D. Inventory

VI. SECURITY OF LICENSED MATERIALS

VII. PERSONNEL MONITORING
   A. Occupational Exposure Limits
   B. Dosimetry
   C. Pregnant Workers
D. Exposure Limits for the General Public
E. Exposure Limits for Minors
F. Bioassays

VIII. INCIDENTS AND EMERGENCIES
A. What is an Incident or Emergency?
B. Notifications
C. Basic Procedures
D. Skin Decontamination

IX. PRACTICAL RADIATION PROTECTION
A. The “Golden Rule”
B. Required Surveys
   1. Post-Experiment Contamination Surveys (Daily Surveys)
   2. Portable Survey Instruments
   3. Monthly Wipe Surveys
   4. Weekly Surveys
   5. Immediate Surveys
C. Preventing Internal Exposures
D. Preventing External Exposures
E. General Lab Safety Practices

X. SPECIAL PROCEDURES
A. Use of Volatile Materials
   1. Iodination Procedures
   2. Reduction Procedures
   3. Other Common Uses Involving Volatile Sources
B. Procedures with Biohazardous Materials

XI. WASTE DISPOSAL PROCEDURES
A. Dry Solid Waste
B. Liquid Waste
C. Mixed Waste
D. Liquid Scintillation Vials
E. Animal Carcasses and Tissues
F. Biohazardous Waste
G. Sharps
H. Radionuclide Disposal Forms (Yellow Cards)
I. Request for Radioactive Waste Removal

XII. SEALED SOURCES AND GENERALLY LICENSED DEVICES
A. Requirements
B. Semi-Annual Leak Tests
C. Labeling Requirements
XIII. RADIATION PRODUCING MACHINES

A. Authorization for Use
B. Acquisition and Initial Inspection
C. Authoree Responsibilities
D. Relocation and/or Repairs
E. Inspections and Enforcement

APPENDICES

A. Characteristics of Commonly Used Radionuclides
B. Fetal Dosimetry Program
C. Application – Authorization to Use Radioactive Materials
D. Application – Authorization to Use Radiation Producing Machines
E. Dosimetry Rules & Limitations
F. Efficiency/MDA Calculations
G. In Vivo Study Application Form
H. Radioactive Material Transfer Form
I. Inspection Checklist Explanation
J. Lab Clearance Checklist
K. Approved Liquid Scintillation Cocktails
L. Post Experiment Survey Form (Daily Survey Form)
M. Post Iodination Survey Form
N. Radionuclide Inventory Log
O. Survey Meter Information
P. Radiation Producing Machine Action Request Form
Q. Common Postings & Labels
I. INTRODUCTION AND ALARA POLICY STATEMENT

A. INTRODUCTION

The use of radioactive materials and machine sources of ionizing radiation are regulated by the United States Nuclear Regulatory Commission (NRC) and/or the New Jersey Department of Environmental Protection, Bureau of Radiological Health (NJDEP). The University of Medicine and Dentistry of New Jersey, Robert Wood Johnson Medical School (UMDNJ/RWJMS), herein referred to as the University, has received licenses of broad scope from both of these agencies permitting considerable autonomy in the use of sources of ionizing radiation and the management of our radiation safety program. For the purposes of this guide, “radiation” may be used interchangeably with “ionizing radiation”.

Non-ionizing radiation-producing equipment is governed by federal and/or state standards and exposure limits, as well as professionally accepted practices pertaining to sources of non-ionizing radiation. Should you have questions or concerns regarding these non-ionizing radiations or their sources, please contact Rutgers Environmental Health & Safety (REHS).

The University has appointed a Laboratory Safety Committee to establish a comprehensive radiation safety program to ensure that all potentially hazardous sources of radiation are used in a safe and compliant manner. This function is directed under the Radiation Safety Sub-Committee of the Laboratory Safety Committee (RSC). In every facility where radioactive materials are utilized, specific methods must be developed to maintain safety and compliance.

By contractual agreement, REHS is responsible for implementing radiation policies and procedures approved by the RSC through a broad range of services. These services include radioactive materials delivery, radiation safety training, x-ray safety, radionuclide authorization and inspection, radioactive waste pick-up and disposal, and emergency response.

This Guide: (1) describes the organization of the radiation safety program and the responsibilities of all levels of employees pertaining to the radiation safety program; (2) specifies the regulations, policies and practices which must be followed when using sources of radiation; (3) describes the radiation services that REHS provides under a contractual agreement to assist the user in his/her safety program; and (4) describes the basics of radiation physics and biological effects.

Work with sources of ionizing radiation may not be initiated until written authorization has been received specifically permitting that work and all training requirements have been met.

B. ALARA POLICY STATEMENT

In practice, radiation doses in the workplace must be maintained As Low As Reasonably Achievable. ALARA is a guideline meant to strike a balance between the costs of radiation protection, the health benefit derived from that protection and the benefit to society as a result of the use of ionizing radiation. The limits for occupational exposure are clearly written into the regulations and constitute the industry’s “standard of care”. Our ALARA program is important and acts as a best management practice. The University’s administration and the radiation safety staff will promote ALARA and assist the research and administrative community in practicing ALARA at every available opportunity.

It is the responsibility of everyone including radiation workers, authorees, REHS and the University administration to maintain operations with ALARA in mind. This is achievable, in part, by outlining safety procedures for work involving radioactive materials and diligently monitoring the workplace to control the spread of contamination. Practical measures to incorporate ALARA into work practices are included in this manual to assist radiation workers. Simple concepts and easily implemented best practices will generally minimize contamination, exposures and releases.
II. PROGRAM MANAGEMENT

A. RADIATION SAFETY COMMITTEE

The RSC, along with the University Administration and the Radiation Safety Officer (RSO) share responsibility for the University’s radiation safety program. The RSC is critical for licenses of broad scope such as Rutgers and allows the University relative autonomy in making decisions regarding the radiation safety program and its management. In line with the high level of standards and integrity set by our administration, a proactive, involved and informed RSC is essential.

The RSC is formally appointed by the Associate Dean for Research. RSC membership is comprised of a member of the Administration, the RSO, and faculty representing the major areas of radionuclide use and radiation producing machines. Whenever practical the various campuses and geographical areas of the University are represented. REHS staff assists the RSC, as necessary.

A quorum of RSC members must be present in order for the RSC to officially transact business. A quorum consists of:

1. The Chair (or his/her designee)
2. The Representative of Administration (or his/her designee)
3. The Radiation Safety Officer
4. At least two other faculty members

The RSC is charged with the following duties:

1. Review and approve the policies for the radiation safety program, including the Radiation Safety Guide to:
   - Promote the practice of the ALARA philosophy for all members of the University community and the general public;
   - Insure compliance with all applicable regulations;
   - Promote the sound and environmentally responsible disposal of waste materials.

2. Approve in advance all authorized uses of licensed materials. This includes new procedures under the RSO’s authorization.

3. Oversee and/or approve the audit of the radiation safety program and the radiation safety office on an annual basis. This audit shall be thorough and may include sections of the program such as: the policies and procedures for controlling and maintaining inventories, possession limits, the procurement and transfer of licensed materials, emergency response, training of users, security, and dosimetry.

4. Approve revisions to the Radiation Safety Guide, as well as other documents and procedures without prior notification to the NRC, as long as these changes are not in conflict with specific license conditions or specific NRC regulatory requirements.

5. Adjudicate any differences between authorized users and REHS.

The RSC typically meets at least four times per year. Students, faculty, staff and members of the general public are encouraged to contact any member of the RSC to discuss issues of concern regarding any aspect of our radiation safety program. A listing of the current RSC members is available on the REHS website or may be obtained by contacting REHS directly.
B. RADIATION SAFETY OFFICER RESPONSIBILITIES

The responsibilities of the RSO are as follows:

1. Provide consultation to authorized users on good radiation safety practices, experimental design, adequate facilities, selection of monitoring equipment, etc.

2. Oversee the receipt, delivery and shipment of radioactive materials.

3. Establish criteria for compliance with state, federal and local regulations, license conditions and the permit conditions authorized by the RSC.

4. Inspect authorized users and their labs to insure compliance with the criteria defined above.

5. Immediately terminate any activity that is found to be a threat to public health and safety, property, or the environment.

6. Provide radiation protection information to personnel pursuant to 10 CFR 19 and 10 CFR 20.

7. Periodically meet with and report to University Administration and the RSC.

The University community is encouraged to contact the RSO or any radiation safety staff member with any questions or concerns regarding the use of ionizing radiation. Email addresses of the radiation safety staff are available on the REHS website.

C. REHS SERVICES

The following is a list of common services provided by REHS.

1. Laboratory Inspections

   REHS staff will inspect labs on a regular basis according to our license requirements. During these inspections REHS will perform the following at a minimum:

   - Check post-experiment surveys and monthly wipe tests
   - Ensure waste is properly segregated and labeled
   - Survey the lab for contamination
   - Ensure the lab is properly posted
   - Provide assistance/advice for radiation related issues

2. Radiation and Contamination Control

   During inspections, REHS will conduct surveys with a portable instrument (if applicable), and may perform wipe tests of the lab on an annual basis. Radiation producing machines are surveyed upon installation, after relocations or repairs and semi-annually depending on the unit classification.

3. Radioactive Waste Disposal and Pick-up

   All radioactive wastes must be disposed through REHS.

   DRAIN DISPOSAL OF RADIOACTIVE WASTES IS PROHIBITED.

   Radioactive wastes are first segregated by waste type (solid, liquid, scintillation vials, animal, etc) and then by half-life. All radioactive wastes shall be segregated in accordance with University guidelines outlined in Section XI, Waste Disposal Procedures.
4. **Personnel Radiation Monitoring**

Staff working with sources of ionizing radiation may be required to wear personnel monitoring badges. Authorees shall ensure that all badges assigned to their laboratory are used properly and returned to REHS on time. REHS maintains all radiation exposure records and can provide an individual’s report upon request. Individuals who do not require personnel monitoring as stated in Section VII of this guide may request a badge, but may be required to pay for the cost of the badge.

5. **Bioassays**

REHS provides bioassay services as needed. Staff performing iodination procedures with I-125 must obtain a thyroid bioassay 24 to 72 hours post-iodination. Bioassay requirements associated with other uses of radionuclides, or in the event of personal contamination, are determined by REHS on a case-by-case basis.

6. **Instrument Checks**

All portable survey instruments are checked for proper operation by REHS on an annual basis. REHS can assist with repairs and coordinate with vendors to arrange repair service.

7. **Radiation Safety Training**

All authorees and radiation workers are required to attend:

- Initial radiation safety training prior to beginning work with radioactive materials and,
- Refresher training annually. In-person refresher is offered at the end of the year, typically in November and December, at various locations around the University. Online refresher training is also offered throughout the year by accessing the PI Information Database on the REHS website.

8. **Emergency Response**

REHS provides emergency response for incidents involving radioactive materials 24 hours a day, 7 days a week. Contact REHS directly during normal working hours and Public Safety at all other times.

D. **ENFORCEMENT POLICY**

1. **Introduction**

A well-functioning radiation safety program is dependent on consistent adherence to the policies and procedures established for the safe use of radioactive materials. The NRC has two basic premises regarding safety: (1) consistently following the requirements leads to safety and (2) the only way to ensure consistent compliance and therefore safety, is through comprehensive management controls.

The NRC expects the University to have a rigorous program of laboratory safety audits. It is important to realize that the NRC holds the institution responsible for the actions of the individuals working here. With this in mind, REHS inspects each laboratory on a regular basis according to our license requirements. These inspections are unannounced and generally very thorough. The results of these audits are discussed with the individual(s) present in the lab at the time of the inspection and a report is forwarded to the authoree.

The self-identification and correction of violations by the University is well regarded by the NRC. Conversely, the failure to identify violations or the failure to correct those identified can lead to enforcement action by the NRC. Whenever possible, REHS works pro-actively with the laboratory community to correct violations and ensure they do not recur. In the event that violations are not corrected or are of sufficient severity, a Notice of Violation (NOV) may be issued to the Authoree.
NOVs are classified as Class I or Class II. Class I violations have the potential to cause risk to human health or welfare, the health or welfare of the environment, or may jeopardize the institution’s licensing status with the NRC or the State. Class II violations do not generally have the potential to cause immediate risk to health or welfare, however multiple or repeat occurrences may lead to the University being out of compliance with its license conditions.

The following are examples of Class I violations:

- Failure to perform and/or document monthly wipe tests or post-experiment surveys
- Failure to use the proper personal protective equipment
- Failure to meet the refresher training requirements
- Allowing new employees to work with licensed material without proper training
- Significant, undetected contamination in the laboratory
- Eating, drinking or smoking in the lab (or evidence thereof)
- Failure to notify REHS or campus police after a major incident
- Improper radioactive waste disposal and/or loss of licensed material
- Failure to secure licensed source material

The following are examples of Class II violations:

- Failure to secure other licensed material
- Lack of secondary containment for liquid wastes
- Failure to properly segregate radioactive wastes
- Failure to maintain an accurate inventory of radioactive materials
- Failure to perform the efficiency, MDA or CPM to DPM calculations on wipe tests
- Failure to maintain a functional survey meter

2. **Authoree Response to NOV**

Authorees must provide a written response to the RSO acknowledging the NOV and detailing corrective actions that will be taken to prevent recurrence. The Authoree may choose to contest the NOV if he/she feels it was issued without sufficient cause. If the Authoree chooses to contest the NOV, a written response shall be provided to the RSO detailing why he/she believes the NOV should be rescinded. If the RSO and the Authoree cannot agree on the disposition of the NOV, the matter will be referred to the RSC for adjudication.

3. **Potential Sanctions**

The RSC, Associate Dean for Research and the RSO may elect to discipline an Authoree in whatever fashion they deem effective and just. It is the RSC’s responsibility to insure that the University retains the ability to use licensed material. They will impose sanctions on individual labs that are recurrent offenders with this goal in mind. Options for sanctions include, but are not limited to:

**Management Meeting**

Management meetings are intended to be used as a tool to impress upon a particular Authoree that he/she needs to significantly improve the oversight of their lab in order to prevent the need for sanctions as listed below. A management meeting will include the Authoree in question, the Associate Dean for Research (or his/her designee), the RSO, and one other member of the RSC. At this meeting, the Authoree will be required to discuss the corrective actions to be implemented to avoid the recurrence of the violations in question. Management meetings may be required when:

- Two inspections within a nine month period have resulted in Class I violations;
- Multiple Class I violations are incurred during a single inspection;
- Multiple and/or repeated Class II violations are incurred within twelve months.
Suspension of Delivery of Licensed Materials

Suspension of delivery of licensed materials will generally be considered when:

- An authoree fails to attend a Management Meeting within four weeks of notification.

- During an incident and until the incident has been fully investigated, root causes identified, and corrective actions implemented.

- At the discretion of the RSO or Associate Dean for Research.

Suspension of Authorization to Utilize Licensed Materials

The total suspension of an authorization to use licensed materials will generally occur when three Class I violations are incurred within a 15 month period. The duration of the suspension will be a minimum of two weeks and will be lifted when the Associate Dean for Research and the RSO are satisfied the Authoree has taken measures to insure the use of radioactive materials in his/her laboratory will be in complete and consistent compliance with the RWJMS policies and procedures.

Any further Class I violations by the Authoree’s laboratory within six months of the end of the suspension will result in an escalated suspension of the authorization.

Immediate Suspension

The RSO are responsible for the safe use of sources of ionizing radiation at the University and may immediately suspend the permit of an Authoree at his/her discretion. In the case of a suspension made unilaterally by the RSO, an emergency meeting of the RSC will be convened to resolve the issue. The suspension will remain in force in the interim.
III. AUTHORIZATION TO USE RADIOACTIVE MATERIALS

A. MINIMUM REQUIREMENTS, APPLICATION AND APPROVAL

The use of radioactive materials at the University is restricted to personnel authorized by the RSC. Faculty and staff meeting the minimum criteria outlined below shall complete and submit an application package to the RSO.

Minimum criteria:

- Hold a faculty or staff position with at least the rank of Instructor, Research Associate, or its equivalent.

- Possess a graduate degree in a Physical Science, Biomedical Science, Life Science, Engineering, or Medicine; and have at least one year of experience working with radionuclides of similar characteristics and activity. Required experience for radiation producing machine authorizations will be handled on a case-by-case basis by the RSO and/or RSC.

- Have the use of adequate facilities and equipment to contain and detect the radionuclides requested. This may include but is not limited to, a laboratory with impervious floor and bench surfaces, a chemical fume hood for volatile materials, appropriate shielding and portable survey instruments capable of detecting the requested radionuclides, and access to a liquid scintillation counter for conducting wipe tests.

- Attend initial radiation safety training

The RSO will review the application, conduct an interview and submit their findings to the RSC for consideration. If authorization to use is granted, a Radioactive Material Permit will be issued by the RSO on behalf of the RSC and will be valid for a period of two years. The permit specifies the name of the Authoree, the room(s) in which radioactive materials may be used, the radionuclide(s) to be used, and the maximum quantity of each radionuclide permitted.

The “Application to Use Radioactive Materials” can be found in the Appendices and on the REHS website.

B. AUTHOREE RESPONSIBILITIES

The Authoree is responsible for the safe use of all radioactive materials obtained under his/her permit and for ensuring that all radiation workers under his/her permit are working in accordance with applicable regulations and University policies at all times.

The Authoree shall:

1. Attend radiation safety training at the required frequency
2. Ensure that all radiation workers attend radiation safety training at the required frequency
3. Ensure that all radiation workers receive in-lab training specific to the procedures and experiments authorized in the permit
4. Ensure that radioactive materials are used only in approved locations listed on the permit
5. Inform all non-radiation workers of the potential health hazards and the safeguards that are established to ensure a safe workplace
6. Administer and enforce the radiation safety rules and regulations as outlined in this guide and other University policies
7. Notify the RSO of any prolonged absences or sabbaticals (in excess of four consecutive weeks) so an alternate Authoree may be identified
8. Ensure laboratory surveys for radioactive contamination are performed and documented at the appropriate frequency and that any follow-up action taken is documented (decontamination, use of shielding) such that any contamination remains below specified limits
9. Notify the RSO of fixed contamination (i.e., contamination that persists despite decontamination efforts)
10. Procure, dispose and maintain an inventory of all radioactive materials in accordance with University policy
11. Maintain security of radioactive materials to prevent the unauthorized removal in accordance with University policy
12. Notify the RSO prior to acquiring:

   Equipment containing radioactive sealed sources such as:
   - Analytical balances,
   - Liquid scintillation counters
   - Electron capture detectors for gas chromatographs
   - Lead paint analyzers
   - Moisture density gauges
   - Irradiators

   Equipment capable of producing ionizing radiation such as:
   - Analytical x-ray units
   - Diagnostic x-ray machines
   - Veterinary x-ray units
   - Electron Microscopes
   - Particle Accelerators

13. **Immediately report** spills, contamination of laboratory personnel to REHS directly. After normal working hours contact Public Safety.

14. **Loss or improper disposal of radioactive materials must be reported immediately to REHS.**

   Failure to comply with the requirements specified in this guide and other University policies may result in enforcement action.

C. **PERMIT AMENDMENTS**

   The RSC can grant amendments to active radioactive material permits such as increases in possession limits, additions/deletions of authorized laboratories, additions of new radionuclides, additional protocols, changes in chemical forms of previously approved material, etc.

   Authorees desiring an amendment to their permit shall submit a written request to the RSO stating the desired change and its justification. The RSO will review the amendment and submit their findings to the RSC for consideration. If the amendment is granted, a revised Radioactive Material Permit will be issued by the RSO on behalf of the RSC.

1. **Policy on Human Use**

   The University’s NRC license prohibits ANY use of radioactive materials in or on humans. No human use experiments will be approved.

   The use of ionizing radiation (e.g., from x-ray machines) on humans must first be approved by the IRB, REHS and potentially by the NJDEP. Currently, the NJDEP prohibits the intentional exposure of humans without a prescription from a licensed medical doctor. Generally speaking, research information may be gathered incidentally to the clinical application of radiation to humans, but may not be the sole purpose without prior approval from the NJDEP.

2. **Animal/In-Vivo Work**

   The Institutional Animal Care and Use Committee (IACUC) reviews and approves all protocols involving animals. Protocols involving the use of radioactive materials, irradiators, or x-rays machines are forwarded to REHS. REHS will review each protocol on an individual basis and submit its evaluation form “In-Vivo Study Using Radioactive Material”, to the RSC or to the IACUC directly if RSC approval is not required. The form “In-Vivo Study Using Radioactive Material” is available in the Appendices and on the REHS website.
The evaluation provides protocol specific guidance on items such as:
- Training requirements
- Posting of cages and rooms
- Disposal of animals and associated radioactive wastes
- Free release of equipment
- Survey frequency and documentation

RSC approval is required when:
- Animal use was not approved as an authorized special procedure in the original radioactive material permit application
- The radionuclide or activity are not currently authorized
- The protocol presents a significant variation on currently accepted research practices

3. **Field-Environmental Use of Radionuclides:**

   The intentional release of radioactive material into the environment, i.e. the release of radioactive materials into rivers or streams for research purposes, is strictly prohibited. Such use requires the approval of both the NRC and the RSC. A detailed copy of your protocol needs to be submitted to REHS several months in advance so that the necessary approvals may be obtained.

4. **Gamma Irradiators**

   Use of self-shielded irradiators requires pre-approval by REHS and special training. Should you require the use a self-shielded irradiator, contact REHS for specific requirements and training information.

D. **PERMIT EXPIRATION AND RENEWAL**

   Radioactive material permits expire two years from the date of issue, at which time they must be renewed to ensure uninterrupted use of radionuclides. REHS will contact the Authoree approximately one month prior to the expiration date with instructions on how to renew their authorization.

   If radioactive material permits are not renewed in a timely fashion, the RSC and/or the RSO may impose sanctions or restrictions on use including, but not limited to the sanctions detailed in Section II, under Enforcement Policy.

E. **POSTING REQUIREMENTS**

   The Authoree is responsible for the proper posting of laboratories, equipment rooms, and other work areas where hazardous materials, including radioactive materials, may be used or stored.

   Each laboratory or area where radioactive materials are used or stored must be posted at the entrance with a “CAUTION RADIOACTIVE MATERIALS” sticker. See Appendix Q for an example of this sticker. The following information should be listed on the caution sign:

   1. The primary contact in case of an emergency. This may be the room supervisor, lab manager, lab technician or Authoree
   2. A secondary contact if the primary contact is not available in an emergency
   3. The contact’s name, campus address (building and room number), and a campus phone number should be listed and kept current

   Refrigerators, freezers, storage areas, and containers in which radioactive materials are stored or transported must have a visible label with the radiation warning symbol and the words “CAUTION RADIOACTIVE MATERIALS”. (see Appendix Q for an example of this posting) The label should also indicate the radionuclide and the quantity (activity) in the container. Radioactive warning labels should be removed from containers if they are empty and not contaminated.
Laboratory equipment, such as flasks, beakers, centrifuges, etc., that contain radioactive materials or are contaminated, must be labeled with radioactive warning labels or tape. (see Appendix Q for an example of this posting)

Equipment containing radioactive sources (e.g. liquid scintillation counters, gas chromatographs with electron capture detectors, etc) have separate posting requirements. Please refer to Section XII, Sealed Sources and Generally Licensed Devices.

While not a frequent occurrence at the University, should a laboratory need to utilize large quantities of energetic beta or gamma emitters, additional posting requirements may be necessary. Please contact REHS for an evaluation.

F. TERMINATION AND REACTIVATION OF AUTHORIZATION

A permit will be terminated when: the Authoree leaves the employment of the University, upon request of the authoree or as the result of an enforcement action by the RSC. An Authoree may also remove a laboratory from his/her permit if radioactive materials will not be used in that laboratory.

A permit may be inactivated upon request if an Authoree has stopped using radioactive materials for an extended period. Inactive status relieves the Authoree of routine requirements such as the quarterly inventory report, monthly contamination surveys or “no use” statements, annual radiation safety training, etc.

To request a permit inactivation, complete the Laboratory Clearance Checklist and fax it to REHS. This form is available in Appendix J and on the REHS website. REHS staff will assist the Authoree with waste disposal and arrange for an inactivation or decommissioning survey.

The original permit can be reactivated at a later time with minimal effort by:

1. Making a written request to reactivate the permit, and
2. Ensuring the Authoree and radiation workers attend radiation safety refresher training prior to anticipated start date.

To request that a laboratory be inactivated or decommissioned, complete the Laboratory Clearance Checklist (found in Appendix J). If renovation work will be done (such as painting, removing floor tiles, moving fixed equipment, etc), REHS must be given 2 weeks notice in order to fully decommission the laboratory. Otherwise, if most of the contents of the laboratory will remain and it will not be used for radioactive material use, REHS will inactivate the laboratory. A gray and white “Inactive” sticker will be posted on the door (see Appendix Q for an example). This reflects that the lab has been surveyed by REHS and found free of contamination, although inaccessible areas such as walls, under refrigerators and other equipment has not been certified free of contamination.

G. RADIATION WORKER RESPONSIBILITIES

A Radiation Worker is authorized to work with radioactive materials under the auspices of a radioactive material permit and is responsible to:

1. Attend radiation safety training at the required frequency
2. Adhere to regulations, license conditions and guidelines pertaining to the safe handling of radioactive materials
3. Report any abnormal occurrence, such as a major incident (spill) or significant contamination to the Authoree and REHS immediately
4. Gain approval of the Authoree and REHS before making changes to experimental protocols
5. Ensure the security policy for radioactive materials is enforced at all times
H. POLICY FOR MINORS WORKING IN LABORATORIES

Minors (any person under the age of 18) including students, full-time employees, part-time employees and both paid and un-paid interns are subject to very restrictive limits regarding exposure to ionizing radiation. The NRC and NJDEP have set exposure limits for minors at 10% of the annual limit for adults. Therefore, minors working with or near radioactive materials or equipment that produces ionizing radiation may not receive a whole body dose in excess of 500 mrem/year.

Any Authoree (PI) who wishes to have a high school student (paid or unpaid) working in their UMDNJ laboratory must consult the Publications section of the EOHSS website at http://www2.umdnj.edu/eohssweb/index.htm. UMDNJ has very strict policies for minors and high school students working in laboratories. Please read the publication “Approval Procedure for High School Students to Intern in UMDNJ Research laboratories”.

Additionally the following forms are required by UMDNJ:

- Proposal Form for High School Student to Conduct Research or Work in a UMDNJ Research laboratory;
- High School Student Sponsorship Form; and
- Parental Consent Statement & Insurance Documentation.

Any minor working in an authorized radioactive material laboratory must have radiation safety training PRIOR to starting work in the lab.

Generally speaking, if the minor will work in your laboratory but not work directly with radioactive materials or radiation producing machines:

- REHS will review the work to be done by the minor;
- Evaluate your laboratory environment regarding the potential for the minor to receive a radiation dose even though he/she will not work directly with the materials/equipment;
- Arrange for radiation safety training for the minor.

If you have a person under the age of 18 who wishes to work with radioactive materials, please contact REHS prior to the start of work. Minors are strongly discouraged from handling licensed materials to protect both the minor and the University. If there are compelling reasons for the minor to work with licensed materials, the request will be given consideration if the student is at least 16 years of age. This consideration will include, but is not necessarily limited to:

1. Protocol review by the RSO
2. Initial radiation safety training
3. Parental consent
4. Radiation Safety Committee approval
5. PI certification of hands-on training
6. PI certification of all experiments minor will perform
7. Supervision at all times
8. Dosimetry

Minors are not permitted, under any circumstances, to: perform radio-iodinations; work with animals in conjunction with radioactive materials; or operate x-ray equipment.

Please contact REHS if you have a minor working in your radioactive material laboratory.
IV. TRAINING

Effective training is an integral part of a safety program. Each individual working with radioactive materials must be informed of the potential hazards present in their work area. Radiation safety training outlines safe work practices and regulations that contribute to a safe and compliant workplace. A training schedule is available on the REHS website.

A. INITIAL RADIATION SAFETY TRAINING

Prior to beginning work with radioactive materials, prospective Authorees and radiation workers must attend an initial orientation. This training covers the basics of radiation science, interactions with matter, safe handling procedures, methods to reduce internal and external radiation exposure, emergency procedures, survey requirements, etc. An examination is given at the conclusion of the orientation to ensure attendees have mastered the concepts. A passing grade of 80% is required.

Upon successful completion of initial radiation safety training, a radiation worker will be added to the Authoree’s radioactive material permit.

B. ANNUAL REFRESHER TRAINING

All Authorees and radiation workers must attend annual refresher training each calendar year following successful completion of initial radiation safety training. Refresher training sessions are available in-person and in an online format available on the REHS website.

Failure to satisfy refresher training requirements may result in an NOV and suspension of radioactive material delivery until the training requirement is satisfied. If there is a lapse of 3 years of no training history, the radiation worker will be required to attend initial training.

C. LAB-SPECIFIC TRAINING

Each Authoree is responsible for providing each new radiation worker with laboratory or experiment specific training to supplement the initial orientation. This training is critical for the safe use of licensed material in your laboratory.

REHS is available to provide “in-service” training upon request. REHS personnel are available to provide general training to lab staff as well as critique protocols involving radioactive materials with regards to the safe handling of those materials. These trainings are meant to supplement, but not replace the experiment-specific trainings provided by the Authoree or his/her designee.
V. ORDERING, RECEIPT, AND TRANSFER OF LICENSED MATERIALS

A. ORDERING RADIOACTIVE MATERIALS

REHS must be notified of ALL incoming radioactive materials (e.g. purchases, gifts, samples from collaborative institutions, etc.).

Radioactive material purchases from a vendor (Ex. GE Healthcare, Perkin Elmer) are made through the Purchasing Department on the Banner System. All purchase orders for radioactive material are forwarded to REHS for approval.

Please Note:
1. The University’s NRC license number (29-15188-01) and the Authoree’s name and 4-digit authorization number must be indicated in the description section.
2. The REHS address must be used as the destination for all radioactive shipments. The address is:
   Rutgers, The State University of New Jersey
   REHS
   27 Road 1, Bldg. 4086
   Piscataway, New Jersey 08854-8036
   Attention: Authoree name & number
3. Notify REHS by phone or through the website of each radioactive material order. The following information must be provided: authoree name and number, purchase order number, date ordered, building name, room number, vendor, nuclide, and quantity. This serves reduces processing time and ensures the material will be delivered on the day it is received.

IF A VENDOR OR CARRIER DELIVERS A RAM PACKAGE DIRECTLY TO YOUR LAB, DO NOT OPEN THE PACKAGE! CALL REHS IMMEDIATELY AT 732-445-2550!

B. RECEIPT OF PACKAGES CONTAINING RADIOACTIVE MATERIALS

ALL packages containing radioactive materials must be delivered to REHS. The major radioactive material vendors (MP Biomedicals, GE Healthcare, Perkin Elmer Life Science, etc.) are instructed to ship all radioactive material to the REHS address only.

Radioactive material packages are recorded and surveyed for external contamination and radiation levels upon receipt. REHS verifies the authoree is authorized for the radionuclide and the possession limits are checked. Authorees exceeding their possession limits will be denied receipt of the radioactive materials package until the discrepancy is resolved or arrangements are made for a radioactive waste pickup.

Radioactive material packages are delivered directly to the lab on the day of receipt, or in accordance with the Authoree’s instructions. REHS must obtain a signature from an authorized user in order to deliver the package. Each lab should keep a copy of the delivery form for at least one year. REHS also provides an inventory log sheet for the Authoree’s use. This form lists the activity of the radionuclide received, chemical form and space to record usage and disposal information. As a condition of accepting the radionuclide, the Authoree and radiation workers must adhere to the Package Opening Procedures, outlined below.

R.E.H.S.
1. Accepting a radioactive material package:
   - Only lab personnel who have been to radiation safety training are qualified to receive and open radioactive material packages
   - Inspect the packaging slip
   - Verify the package belongs to your laboratory
   - Verify the radionuclide and activity are correct
   - Place the package in a secure area such as a locked refrigerator or a lockbox if it will not be opened right away

2. Removing the “pig” and the stock vial:
   - Wear gloves, lab coats and safety glasses
   - Use shielding if necessary (lucite or plexiglass shielding for high energy beta emitters such as P-32 and lead shielding for gamma emitters such as I-125)
   - Verify the label on the primary vial has the correct radionuclide activity and volume
   - Wipe test both the plastic or lead pig and stock vial
   - For H-3 you must count the wipes in a liquid scintillation counter (LSC)
   - For nuclides other than H-3, wipe the pig and stock vial and hold the wipe up to the appropriate meter (use a pancake probe for C-14, P-32 and S-35 or a sodium iodide probe for I-125)
   - If the meter survey or LSC results of the vial wipe are consistent with background, place the material in a secure area
   - If the results are above background, contact REHS for assistance

3. Disposal of Boxes and Packing Material:
   - Survey the packing material for contamination with the appropriate survey meter (see above). Note: not necessary for H-3
   - If meter survey results are consistent with background, continue with the procedure. If meter survey results are above background, dispose of the packaging material in your solid radioactive waste container and contact REHS
   - Verify the box is completely empty
   - Deface any radioactive symbols or appearance of the words “radioactive material” before disposing into regular trash

C. TRANSFER OF RADIOACTIVE MATERIALS

1. Transfer within the University

Authorees who wish to transfer radioactive materials to another Authoree within the University must complete and submit a Transfer of Radioactive Material form (available in the Appendices and on the REHS website) prior to or soon after transferring the material. Once approved the Authoree shall use a secondary container and transfer the radioactive material by walking it from one location to another. REHS will update each Authoree’s inventory based on the form data.

Research staff is prohibited from transporting radioactive material by motor vehicle and are prohibited from offering radioactive material for transport to a commercial or private carrier due to Department of Transportation (DOT) regulations.

2. Transfer outside the University

All radioactive material shipments must conform to DOT and NRC regulations. Therefore all shipments of radioactive materials leaving the University must be approved, packaged and shipped by REHS. REHS will also obtain the authorization of the RSO at the receiving institution and request a copy of the receiving institutions radioactive materials license.

Contact REHS at least two days in advance to ensure the necessary arrangements can be made. REHS requires the following information:
• Radionuclide
• Activity
• Chemical form
• Package requirements (e.g. dry ice, blue ice, ambient)
• “Ship to” or recipient information (e.g. name, address, telephone number)

Research personnel must prepare an inner package according to REHS’ guidance that may include dividing the samples into two or more packages. REHS will pick up the inner package, complete the packaging and shipping papers and arrange for delivery. The Authoree is responsible for covering any charges associated with the radioactive material shipment.

D. INVENTORY

The University as a licensee is required to maintain an accurate inventory of all radioactive materials present. Therefore, each Authoree is required to maintain an adequate inventory log and have knowledge of the various forms and quantities of radioactive materials present in their laboratories. REHS staff will check inventory logs during quarterly radiation safety inspections.

Every calendar quarter, an Authoree is required to complete a quarterly Inventory Verification Report (IVR). All transactions that took place during the previous quarter are listed on the IVR. These include delivery of radioactive materials, removal of radioactive waste, transfers of radioactive material to another Authoree within the University, transfers of radioactive material to another institution, and correction of data entry errors.

Authorees must review the IVR, compare it to their current inventory and if correct, sign and date it prior to returning a copy to REHS. If there are errors, the appropriate corrections should be made on the report along with a short explanation. REHS will make the necessary changes, which will be reflected on the next quarterly IVR.

Failure to return a signed copy of the inventory form in a timely manner will result in the suspension of delivery of radioactive materials. Delivery will be reinstated upon receipt of a signed copy of the inventory report.

Useful tips for keeping an accurate inventory include:

• Radioactive Material Packages: Keep ALL paperwork associated with an incoming radioactive material delivery
• Utilize the “Radionuclide Inventory Log” provided with each radioactive material delivery
• Waste Cards: Always keep a copy of the yellow card associated with waste pickups
• Pay careful attention to the Start Date and End Date on the IVR. Only transactions that occur within the reporting dates noted will appear.
• When ordering short half-lived nuclides, the vendors usually ship more than the ordered activity. REHS assigns the actual activity received to the Authoree inventory, not the amount that was ordered. Laboratories need to keep track of the total amount received.
• Activity in waste containers REMAINS ON THE AUTHOREE’S INVENTORY. Waste is only deducted from the inventory after it is physically removed from the lab.
• Radioactive decay that occurs while the nuclide is in the possession of the Authoree is not taken into consideration
VI. SECURITY OF LICENSED MATERIALS

The NRC and the NJDEP require that radioactive materials be secured against unauthorized removal. All radioactive materials must be secured or under the immediate control and surveillance of the user. Each Authoree is responsible for maintaining the security of radioactive materials under their authorization.

Security shall be achieved by the following:

- All source vials of radioactive material shall be under lock and key when not in use – whether or not the lab is occupied. Lock boxes or attaching a lock to the exterior of the refrigerator/freezer are acceptable methods; and

- All laboratories that store radioactive material in any form must be locked when staff is not present; and

- Maintaining surveillance of radioactive materials while they are in use; and

- Challenging unauthorized entry into the lab. Question all visitors as to the nature and purpose of their visit.
VII. PERSONNEL MONITORING

A. OCCUPATIONAL EXPOSURE LIMITS

Exposure standards have been established by the NRC and set at a level where apparent injury due to ionizing radiation during a normal lifetime is unlikely (see chart below). This limit is called the “maximum permissible exposure.” It is the responsibility of each individual to keep his/her radiation exposure ALARA, and to avoid exposure to radiation when such exposures are unnecessary.

### Maximum Permissible Annual Occupational Exposure Limits

<table>
<thead>
<tr>
<th>Part of Body</th>
<th>Radiation Worker Limits (mrem/year)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Whole body</td>
<td>5,000</td>
</tr>
<tr>

</tr>
<tr>
<td>Single organ dose</td>
<td>50,000</td>
</tr>
<tr>
<td>Skin of whole body</td>
<td>50,000</td>
</tr>
</tbody>
</table>

B. DOSIMETRY

The University shall monitor exposures to radiation and radioactive materials at levels sufficient to demonstrate compliance with the occupational dose limits as specified in Title 10, Code of Federal Regulations, Part 20.

As required by NRC, NJDEP, and/or University policy, the University shall monitor occupational exposures to radiation and shall supply and require the use of individual monitoring badges to:

- Adults likely to receive, in 1 year from sources external to the body, a dose in excess of 10 percent of the limits in 20.1201(a)
- Individuals entering an area designated as a “Radiation Area"
- Individuals who use x-ray units
- Declared pregnant workers
- Minors (those under the age of 18) working with radioactive materials

This policy precludes the need for dosimetry for most University personnel. A determination as to which individuals require monitoring will be made by the RSO on a case-by-case basis, based on the potential hazard and exposure histories for such uses. REHS issues dosimetry to those workers who:

- Perform radio-iodination procedures using I-125 or I-131
- Perform experiments such as cell labeling utilizing at least 1 mCi of P-32 at a time
- Use of most x-ray producing machines
- Use of gamma emitters other than I-125

Whole body badges are worn to provide an indication of the maximum dose received by the trunk of the body. Ring dosimeters should be worn so that the portion containing the LiF ‘chip’ is facing in the direction of the radiation source. This chip is located behind the nameplate on the badge. The ring should be worn under the glove of the hand that holds the radiation source most frequently.

Radiation dosimeters are not assigned to all individuals who work with or around sources of ionizing radiation. The energies of the most commonly used radionuclides are of insufficient energy to be detected by the dosimeters. This is not a risk to the worker under normal conditions because these radiation types are not penetrating enough to cause a deep dose. Examples of these radionuclides are H-3, C-14, P-33 and S-35. Although the radiations from these radionuclides are not capable of delivering a “deep” dose, care must still be taken to insure that none are deposited internally (ingested or inhaled) or deposited on the bare skin. The use of proper engineering controls and personal protective equipment (PPE) should minimize this small risk. Performing surveys and hand washing should mitigate
any consequences in the instance of skin contamination.

Radiation badges provide legal documentation of external radiation exposure received while working with radioactive materials. Care should be taken to make sure that badges do not become contaminated with radioactive materials. Lost or misplaced badges should be reported immediately to REHS in order to receive a replacement. Under no circumstances should workers wear a dosimeter belonging to another individual. It is also important to return your badge quarterly during the radiation badge exchange period. A complete list of Dosimetry Rules and Limitations for research staff is available in the Appendices and on the REHS website.

All quarterly and annual exposure reports are maintained at REHS. REHS will distribute a “Form 5 –Occupational Exposure Record for a Monitoring Period” to any individual who received a measurable dose in the previous calendar year. This excludes approximately 90% of the badged population at the University, since most doses are “ND” meaning Non-Detectable by the dosimeter. Individuals may contact REHS at any time during the year to obtain a copy of their dosimetry records.

It takes approximately four to six weeks to have badges exchanged, mailed and processed by our vendor. In the event an individual’s dose exceeds our internal ALARA limits (10% of the NRC’s limits), the RSO or a member of his/her staff will contact the individual and an investigation will be initiated to ensure ALARA principles are being utilized. A measurable dose below the occupational exposure limits is not a violation, nor does it imply work practices are not appropriate.

C. PREGNANT WORKERS

A special situation arises when a radiation worker becomes pregnant. Under these conditions, radiation exposure could also involve exposure to the embryo or fetus. A number of studies have indicated that the embryo or fetus is more sensitive than the adult, especially during the first trimester of pregnancy. This can be a concern since many women are unaware of their pregnancy during the first month or two of gestation. Hence, the NRC requires that all occupationally exposed workers be instructed in the potential health risks associated with prenatal radiation exposure.

As defined in 10 CFR 20.1003, a “declared pregnant woman” means a woman who has voluntarily informed her employer, in writing, of her pregnancy and the estimated date of conception. The maximum permissible exposure to the fetus of a declared pregnant worker during the gestation period is 10% of the NRC’s annual limits or 500 mrem. An effort should be made to maintain monthly doses below 50 mrem in order to prevent exposure variations. There are very few laboratories at the University where radiation levels are high enough that a fetus could potentially receive a dose that approaches these limits.

If a radiation worker becomes pregnant, she is advised to declare her pregnancy in writing. This can be done by email or by filling out (and signing) an application for a monthly fetal monitoring badge. At this time the prenatal exposure limits take effect. If she wishes, a pregnant worker may meet with a member of REHS to assess her potential radiation exposure and measures to keep her exposures ALARA. Early declaration of a pregnancy is encouraged and confidentiality is maintained at all times. A pregnancy declaration form is available in the Appendices and on the REHS website.

If notification of a pregnancy is not made in writing, the radiation exposure limits remain at the occupational limits of 5,000 mrem per year. An individual may also “un-declare” her pregnancy in writing at any time.

D. EXPOSURE LIMITS FOR THE GENERAL PUBLIC

Visitors to a radiation laboratory who are not classified as occupational radiation workers by the University, lab workers who are not trained in radiation safety, custodial and maintenance staff, and any non-radiation worker are all considered members of the general public.

In accordance with 10 CFR 20.1301, members of the general public shall not receive a radiation dose in excess of 100 mrem in any one year or a dose from external sources of 2 mrem in any one hour. In the laboratory this can be achieved by: storing radioactive materials appropriately, performing post-experiment surveys, labeling all radiation sources and instruments, using appropriate shielding, cleaning up spills promptly and educating other staff when they enter lab.
E. **EXPOSURE LIMITS FOR MINORS**

For students and employees who are under the age of 18, in accordance with 10 CFR 20.1207, the annual occupational dose limits for minors are 10% of the annual dose limits specified for adult workers in 10 CFR 20.1201. This means that minors who work in radioactive material labs cannot exceed a whole body dose of 500 mrem in any one year.

Please refer to Section III, Subsection H for details of the Policy for Minors Working in Laboratories.

F. **BIOASSAYS**

Conditions of our license issued by the NRC require that bioassays be provided for workers using certain types and amounts of radionuclides. Bioassays are performed for the following:

- Individuals performing iodinations of I-125 or I-131 are required to obtain a thyroid bioassay 24-72 hours post iodination
- Individuals handling greater than 100 mCi of tritium (H-3) must submit a urine sample to REHS for bioassay within 24 hours of the handling. This bioassay must be performed each time this quantity of tritium is handled.
- In the event of a spill, release or contamination incident, REHS may require further bioassays from an occupational worker.
- At the discretion of the RSO
VIII. INCIDENTS AND EMERGENCIES

A. WHAT IS AN INCIDENT OR EMERGENCY?

Incidents may occur during the use of radioactive materials, such as spills, contamination of the worker or work area and accidental release into the air. When an incident occurs, the worker must first make a judgment as to whether the incident is a minor or major incident. The chart on the following page will help you to make this determination. When in doubt, call REHS. **There are no penalties for reporting an incident or requesting assistance regardless of what the circumstances or actions leading up to the incident.**

B. NOTIFICATIONS

The proper response to an emergency depends upon a thorough understanding of the magnitude of risks, priorities for action and the application of common sense. When calling REHS to report a spill, the following information should be provided:

- Location of incident
- Author: the person reporting
- Name and telephone number of person reporting
- Persons contaminated or exposed, estimate of amount on skin
- Radionuclide involved
- Activity
- Volume of released material
- What steps have been taken so far

In the event of a spill or emergency during normal business hours, REHS should be contacted directly. After business hours contact Public Safety at 5-4000.

C. BASIC PROCEDURES

When radioactive material is in an unwanted or unplanned location, it is called contamination. This may be on floors, equipment, work areas, people or areas outside the authorized laboratory. Fortunately, most radioactive contamination is easy to clean to background levels in a reasonable amount of time and at a reasonable cost. Concentrated liquid decontaminating agents are available from most scientific suppliers. Foam cleansers, such as bathroom or kitchen cleaners are just as effective at a much lower cost. Many other agents will work to clean radioactive contamination that has been resistant to other cleaners. The following are two formulas that have been found to work.

**SURFACE DECONTAMINATION SOLUTIONS**

1. For I-125:
   25 g Sodium Thiosulfate
   2 g Sodium Iodide
   in 1 Liter of 1M Sodium Hydroxide

2. For P-32, etc:
   50 mL Triton
   20 g EDTA
   100 mL decontamination detergent (such as Count-Off, RadCon)
   Add enough distilled water to make 1 liter of solution.

### Emergency Contacts

**DURING BUSINESS HOURS:**

CALL REHS AT 732-445-2550

**AFTER HOURS:**

CALL PUBLIC SAFETY 5-4000
D. **Skin Decontamination**

REHS must be notified immediately if any personal contamination (i.e., contamination on clothing, lab coats, skin or any part of the body) occurs or is suspected. It is important keep a record of the following:

- The amount of contamination found – the maximum meter reading in CPM - be careful to note the scale you are using
- The approximate area of skin contaminated – mark it with a pen or marker
- The time the contamination was discovered and the time the contamination was removed
- Record the survey meter used and set it aside for REHS inspection

1. Personnel who have identified contamination should begin decontamination immediately by washing the affected areas with warm water and mild soap.

2. Personnel assisting in decontamination will use necessary precautions and PPE to prevent the spread of contamination to their person or the surrounding area.

3. Decontamination will be performed in a manner to avoid spreading it to other parts of the body. All cleaning should be done from the periphery of the contaminated area towards the center.

4. When washing a contaminated area of the body, care must be taken to prevent abrasions or cuts of the skin to prevent internal contamination. Do not use a scrub brush.

5. Wash skin with mild soap and lukewarm water only. Wash repeatedly until REHS personnel arrive, the contamination has been removed, or further washing will abrade the skin.

6. When drying an area of the skin that has been decontaminated by washing, do not rub the skin; pat it dry.

7. In the event that the affected area is not being effectively decontaminated – do not try any alternate decontamination methods until REHS arrives. REHS will make the determination for further actions.
IX. PRACTICAL RADIATION PROTECTION

A. THE “GOLDEN RULE”

Prior to leaving the laboratory, after working with radioactive materials, each individual shall:
Monitor his/her person and work area with the appropriate survey instrument and thoroughly wash his/her hands. Following this simple rule will mitigate or eliminate the vast majority of radiological contamination events and significantly minimize their impact.

B. REQUIRED SURVEYS

Whenever unsealed sources of radioactive material (i.e., liquid solutions in vials, test tubes, flasks, etc.) are handled, it is possible to contaminate laboratory benches, floors and equipment, as well as hands, skin and clothes. Every laboratory where radioactive materials are handled must be surveyed for radioactive contamination on a regular basis. Surveying the lab for contamination is essential to prevent the spread of contamination to equipment and personnel working in the laboratory and will help prevent inadvertent internal depositions of radioactive materials as well as reduce external exposures.

1. Post-Experiment Contamination Surveys (Daily Surveys)

Post-experiment surveys must be performed after every use of unsealed radioactive materials, with the exception of H-3. These surveys should be performed with a portable survey instrument but may be performed via wipe test if an appropriate instrument is not available. An appropriate survey instrument for performing daily surveys is considered to be a Ludlum Model 3 with a pancake Geiger-Mueller (G-M) detector or equivalent. End-window G-Ms are unacceptable as they lack sufficient sensitivity for mid to low energy beta emitters. For low energy gamma emitters such as I-125, an acceptable instrument is a Ludlum Model 3 with a sodium iodide (NaI) probe. REHS performs an efficiency check annually on all survey meters. If you need assistance in purchasing a meter, or suspect that your meter is not working properly, please contact REHS for advice.

A post-experiment survey must include the following:

1. **Personal Survey**: Gloves, hands, skin, lab coat, shoes, and clothing.
2. **Equipment Survey**: Any equipment used during the radioactive material experiment such as centrifuges, vortexes, refrigerators, gel dryers, etc.
3. **Bench Survey**: All benches that were used during the experiment and drawers that were handled.
4. **Floor Survey**: The floor in front of all areas used during the experiment.
5. **Trash Survey**: Survey the non-radioactive trash to ensure no radioactive material was accidentally disposed of in the regular trash.

*Daily surveys must be documented at least once each day* radioactive material is used on the Post Experiment Survey Form. The surveyor shall include the date and his/her initials. A copy of this form is available in the Appendices and on the REHS website.

Any area with survey results above background should be carefully examined for contamination. If contamination is confirmed the area must be decontaminated and re-surveyed. This should be noted on the Post Experiment Survey Form. Areas such as the inside of labeled waste containers or mild contamination on the inside of labeled centrifuges need not be decontaminated. In the event you are unable to decontaminate an area, or are unsure of how to proceed, please contact REHS directly.

2. **Portable Survey Instruments**

When using portable survey instruments, it is essential that the proper techniques be employed to ensure accurate results. The guidelines below must be followed when using a survey instrument:

- Use the correct detector or probe
  1. G-M with pancake probe for P-32, P-33, C-14, S-35, Cr-51
  2. NaI probe for I-125 or Cr-51
• Check the battery and ensure the instrument is operable by holding the detector near a known source of radiation.
• Ensure that you select the proper scale on the instrument for conducting the survey. Always start with the lowest scale available, i.e., x0.1 or x1 scale. Select higher range scales as necessary to obtain maximum readings if contamination is detected.
• Hold the detector approximately 1 cm above the surfaces to be monitored. If the detector is too far away, underestimation of activity may occur. If the detector is too close to the surfaces being monitored, contamination of the detector may occur.
• Survey slowly; the sensitivity of the detector is inversely proportional to increasing survey speed. As a rule of thumb, survey 1 to 2 inches per second.
• Do not cover the probe with parafilm or Saran wrap. These covers will act as a shield and decrease the detection capability of the meter.
• Use the instrument’s audible response while conducting surveys. The audible response is faster than the meter scale indication. You should listen for any increases in “clicks” above background levels.
• Make sure the meter is set on F for fast and not S for slow. This provides a “real-time” detection response.
• **Important:** Remember that H-3 is such a low-energy beta emitter that it cannot be detected with a survey meter. Monthly or weekly wipe tests are the only available method to detect H-3 contamination.

### 3. Monthly Wipe Surveys

A monthly wipe test must be performed each month that radioactive material is used to ensure the lab is free of contamination. Counting of wipes should be performed in a liquid scintillation counter or gamma counter, if appropriate. The efficiency and Minimum Detectable Activity (MDA) of the counter must also be calculated. Records of monthly wipe surveys, raw data, and efficiency and MDA calculations of the counter are to be maintained on file in the laboratory and will be reviewed by REHS during laboratory inspections. If no radioactive material was used in a given month, a wipe test is not required, although “No Use” statements must be documented in the monthly wipe test logbook.

At the discretion of the RSO, a laboratory may be required to perform bi-monthly wipes based on the risk posed by a specific radionuclide, the level of activity utilized or past evidence of undetected contamination in the laboratory.

REHS has designed an Excel spreadsheet that can be used to assist the laboratory when performing the appropriate calculations for, and the proper documentation of, their monthly wipe surveys. It is an invaluable tool for the researcher. Please refer to the REHS website to download a copy of the program.

The wipe test is a measure of removable (loose) surface contamination. If you suspect contamination, use a survey meter with an appropriate detector to survey bench tops, fume hoods and other work areas. If any areas are above background levels, then decontamination procedures might be necessary prior to taking wipe samples.

Using filter paper disks or cotton swabs, take a series of wipes using moderate pressure from working surfaces where contamination may be expected to exist. Each wipe should be numbered and the location where they are taken shown on a diagram (map) of the room. The wipes can be moistened with alcohol or water and should be rubbed with moderate pressure over a surface area of about 100 square centimeters (the approximate size of a dollar bill). Use the “S” technique to wipe a large area of the bench or floor. Analyze the wipes using the appropriate counter. A background or blank vial and the appropriate standard should also be run with the sample wipes in order to calculate efficiency, net disintegrations per minute (dpm), and MDA. These calculations are summarized in the Appendices. If any H-3 is used in that month, a H-3 standard should be used to calculate efficiency and MDA. If the lab is using P-32, C-14, S-35 or P-33, a C-14 standard can be used for efficiency and MDA calculations. If other radionuclides such as Cr-51 are used, contact REHS to discuss the appropriate standards to use.

The amount of removable contamination shall be recorded in units of dpm /100 cm². The action limit for decontamination is 100 dpm/100 cm² above background. This means that any wipe over 100 dpm/100 cm² needs to be decontaminated with RadCon or similar cleanser and resurveyed to confirm removal of any contamination. The cleaned and re-wiped sample results should be kept in the monthly wipe book along with the previous wipe test results.
Refer to the following procedure for liquid scintillation counting:

- Deposit wipe sample in a clean scintillation vial
- Fill vial with scintillation cocktail to cover wipe or swab (3-4 ml is usually enough)
- Tightly cap the vial
- Invert the vial a few times
- Count the samples, a background or blank sample, and the appropriate standard vial for one minute
- Review the printout and perform the calculations. A sample result with greater than 100 dpm/100 cm² above background must be cleaned and re-wiped until the area is below the action limit.

**Important Notes:**
- If laboratory personnel cannot remove contamination, contact REHS.
- Remember, the lab may utilize the Excel spreadsheet available on the REHS website.

4. **Weekly Surveys**

   *Weekly wipe tests must be performed if more than 10 mCi of H-3 is utilized in one week.* Since a G-M detector with a pancake probe cannot detect the low energy beta emitted by H-3, only a wipe survey is effective for detecting H-3 contamination. These surveys shall be documented and the records held with either the Post-Experiment Survey Forms and/or the monthly wipe tests.

5. **Immediate Surveys**

   Immediate surveys must be performed following iodination procedures. These surveys of your person and work area must be documented on the Post-Iodination Survey Form provided to you upon your delivery of iodine. The form is also available in the Appendices and on the REHS website. The completed survey must be returned to REHS when the iodinator obtains his/her thyroid bioassay. Please refer to Special Procedures, Section X, for more details regarding the requirements surrounding iodination procedures.

   Depending on the radionuclide and activities used, other immediate surveys may also be required at the discretion of the RSO.

C. **PREVENTING INTERNAL EXPOSURES**

Radioactive materials may be deposited internally, typically through one of four routes of entry: inhalation, ingestion, absorption through the skin and injection. While external radiation hazards typically arise from gamma emitters, all forms of radioactive materials may deliver internal doses, with alpha and beta emitters contributing a large percentage of their energy to the total dose. Doses resulting from internal depositions may be acute or chronic. The actual dose delivered due to a unit uptake will vary widely between the radionuclide and individual. The physical half-life of the radionuclide and the biological half-life of the chemical form it is attached to will greatly affect the total dose delivered.

Work practices shall be designed to reduce the risk of internal exposure. *If you suspect that you have had an internal exposure, contact REHS IMMEDIATELY during normal business hours or contact Public Safety outside of normal business hours.* Depending on the metabolic characteristics, the ability of the REHS staff to collect bioassays soon after the suspected uptake may be vital in calculating the delivered dose.

Measures to reduce the risks of internal exposure include:

- Informing REHS whenever you propose to work with volatile sources of licensed materials.
- Work with volatile sources in an approved, properly functioning fume hood or filtered glove box.
- Utilize proper PPE when handling unsealed sources of licensed material, e.g., lab coat, long pants, closed toed shoes, double gloves, etc.
- Handle contaminated sharps with care and dispose of them only within properly labeled sharps containers.
- Thoroughly survey your person and work area with the appropriate survey meter after working with licensed materials and wash your hands prior to leaving the laboratory.
D. Preventing External Exposures

External hazards arise when radiation from a source external to the body has the ability to penetrate the body and deposit energy, causing a “dose”. These exposures can be from gamma, x-rays, neutrons or beta particles. The exposure is dependent upon both the type and energy of the radiation.

Most beta particles do not normally penetrate beyond the skin, but when sufficiently intense, can cause skin and/or eye damage. Very energetic beta particles, such as those emitted by P-32, can penetrate several millimeters into the skin. Shielding is needed in order to reduce the external radiation exposure. Typically, a maximum of ½ inch thick sheet of Plexiglas or acrylic is an effective shield for most beta particles.

**Note:** The vast majority of radionuclides utilized in a University setting are beta emitters. Most beta emitters, if deposited on the surface of the skin, may cause locally high skin doses. Remember, the occupational dose limit for the skin is only 50,000 mrem/yr. It is very important to survey your person and wash your hands after every use of radioactive materials to prevent an inadvertent overexposure.

Alpha particles, because of higher mass, slower velocity and greater electrical charge compared to beta particles, are capable of traveling only a few inches in air and rarely penetrate the outer dead layer of skin. Therefore, alpha particles do not present an external radiation hazard.

X-rays and gamma rays, along with neutron radiation, are very penetrating, and are of primary importance when evaluating external radiation exposure and usually must be shielded. The onset of first observable effects of acute radiation exposure, diminished white blood cell count, may occur at a dose of approximately 100 rads (which is approximately equal to 100,000 mrem) of acute whole body radiation exposure. The Lethal Dose for 50% of the human population (LD50) is about 400 rads whole body exposure, assuming no medical intervention.

Exposure to external radiation may be controlled by limiting the time spent in the radiation field, working at a distance from the source of radiation, using shielding between the worker and the source, and by using no more radioactive material than is necessary.

External radiation exposures can be reduced using three basic tools: **time, distance and shielding.**

**Time**

Radiation dose is directly proportional to exposure time. Therefore, one of the simplest methods of reducing exposure is to limit the time spent exposed to the radiation. Below are a few suggestions to help reduce exposure time:

1. Preplanning - Conduct ‘dry runs’ of the experiment without using radioactive materials, gather all equipment and supplies needed to perform the experiment prior to the start of work, and conduct the work efficiently.

2. Postings - Signs posted in radioactive material work areas will help to keep non-essential personnel away from the radiation field and remind researchers to avoid the area.

**Distance**

The intensity of a point source of gamma radiation is inversely proportional to the square of the distance (Inverse Square Law). Therefore, greater distance means lower dose. In a research setting, a small increase in distance can greatly reduce exposure to hands or other extremities. Doubling the distance from the source (in most cases this may only be a few inches) will reduce the exposure by a factor of four. Tripling the distance will reduce the exposure by a factor of nine. Do not increase the distance to the source to the point where dexterity or control of the material is compromised. The use of remote handing tools and the storage of radioactive material in a remote area are extremely effective in reducing radiation exposure when practical.
**Shielding**

1. Gamma radiation - Gamma radiation is diminished in intensity by any given absorber, but not completely stopped. Materials having a high atomic number (Z) can absorb more gamma radiation than lighter elements. Lead is a frequently used shielding material. A convenient way to determine the thickness of shielding necessary is to use the concept of Half Value Layer (HVL) which is the amount of shielding which reduces the incident radiation by one-half. This value is commonly advertised with various shielding products. Call REHS for assistance in determining shielding requirements for special needs.

2. Alpha and Beta particles - Due to the fact that alpha and beta particles deposit so much energy over such a short distance they are easy to shield. Alpha particles require little or no shielding as they travel only very short distances in air. Low density (Z) materials, such as plexiglas or acrylic, make excellent shielding for beta particles. Thin layers of high density materials such as lead (lead foil) must be avoided when shielding high-energy beta emitters such as P-32. This configuration may cause the production of Bremsstrahlung radiation (x-rays) and potentially INCREASE the external hazard of the beta source.

3. Neutrons - The properties of neutrons vary depending on their energies. Because of this, the type of shielding may vary. Generally, any hydrogen-rich material such as paraffin will suffice. Additional types of shielding may be required due to the production of radioactive materials via interactions with neutrons. If work with neutron producing materials/equipment is going to occur, REHS must be contacted prior to commencement of work.

**E. General Lab Safety Practices**

- All personnel must be current with training requirements (initial and refresher training) to use radioactive materials.

- Appropriate PPE shall be used when working with radioactive materials: buttoned lab coats, eye protection and double gloves. PPE should be removed before leaving the laboratory.

- Dosimeters shall be worn appropriately by the assigned individual and exchanged in a timely manner. Dosimeters shall be stored in a low radiation environment when not in use (i.e. desk drawer).

- Eating, drinking, smoking and the application of cosmetics are prohibited in the laboratory. Food, beverages and utensils shall not be stored or disposed in the laboratory.

- Use appropriate shielding and other dose reduction techniques to minimize radiation exposure in the laboratory.

- Use absorbent padding or work in a spill tray – clearly mark the work area “Caution Radioactive Material”.

- All operations involving potentially volatile radioactive materials should be conducted in a properly operating fume hood.

- Each authoree must have available an operable radiation survey instrument appropriate for the radionuclides in use.

- Radioactive materials being moved between authorized locations of use shall be placed in appropriate containers to contain spills and/or prevent exposure. Each container shall be placed in a secondary container and transported on a cart when practical.

- Radioactive waste shall be disposed of according to REHS guidelines. **Drain disposal of radioactive waste is strictly prohibited.**

- Provide for the security of all radioactive materials in accordance with University policy.

- Wash hands thoroughly and survey yourself and your work area after working with radioactive material.

- Report all accidents involving radioactive materials to REHS or Public Safety after working hours.
X. SPECIAL PROCEDURES

A. USE OF VOLATILE MATERIALS

Certain chemical reactions may generate radioactive gases thereby increasing the risk of inhalation by the user. Procedures such as iodinations using I-125 or I-131 and reduction experiments using sodium borohydride (H-3) require prior approval of the RSC due to their increased potential for volatilization.

1. Iodination Procedures

I-125 is widely used for the preparation of tracers for immunoassays and other procedures for the detection and localization of biological samples. I-125 exhibits certain physical chemical and biological properties that necessitate special handling to ensure researcher safety and regulatory compliance.

The gamma and x-ray emissions of I-125 are easily shielded by lead foil. Internal exposure by inhalation is the primary hazard. When inhaled, 67-70% of the activity will be deposited in the body and ~30% of that deposition will be taken up by the thyroid and retained with an estimated effective half-life of 40 days. An ingestion of 40 uCi or an inhalation of 60 uCi of I-125 would cause an individual to reach the NRC’s annual exposure limit.

Approval

The RSC must approve iodinations as an authorized procedure on a radioactive material permit.

REHS approves each iodinator on an individual basis. REHS will review the protocol and observe each iodinator during a “dry-run”. As part of the approval process, each iodinator is responsible to:

- Obtain a baseline thyroid bioassay from REHS prior to use
- Apply for whole body and extremity dosimeters
- Perform dry runs of the experiment (without radioactivity) to become familiar with the procedure.
- Submit a copy of the iodination procedure to be followed

PROCEDURE NOTES: Stock vials should be vented with a charcoal trap (contact vendor) to remove any build-up of Iodine in the headspace of the vial. Iodinations should be “closed system” with additions and removals being performed with a Hamilton syringe. The volatility of Iodine is enhanced at low pH, do not add acid and carefully review the manufacturer’s package instructions.

- Submit the room location and the desired hood for review.

PROCEDURE NOTES: The hood must be vented directly to the roof and ideally be directly ducted and not ganged with other hood ducts. The hood shall have a demonstrated face velocity of 80 -100 linear feet per minute at a sash height of no less than 18 inches. The face velocity shall be determined annually and documented on the stickers affixed to each hood. This data will be used to calculate effluent data.

- Arrange for REHS to observe the last dry run. The iodination shall be performed with mock versions of all buffers, solutions, equipment, etc., that are to be used in the “real” procedure.

- Upon successful completion REHS will authorize the individual for iodinations by entering the applicant into the iodination program database.

Work Place Preparation and Requirements - Particular attention should be paid to glove selection and its chemical compatibility with the reagents involved.
The following personal protective equipment is needed:

- Safety glasses
- Lab coat – disposable is recommended
- Double gloves – sleeve guards recommended

All iodination procedures must be performed in an approved fume hood.

A survey meter with a low energy gamma probe must be operable and turned on during the procedure.

A post-experiment wipe test and personal survey must be performed and documented immediately after the iodination procedure. The survey forms will be delivered with the I-125 order. The post-iodination survey form is also available in the Appendices and on the REHS website.

Radioactive waste containers may require shielding – REHS can help determine shielding requirements during the approval process. Consider making a solution of Iodo-Mix (0.1M NaI, 0.1 M NaOH, 0.1M Na₂S₂O₃) to have for application to spills, to rinse equipment and to add to the liquid waste containers to help stabilize the radioiodine and reduce volatilization.

The iodinator must obtain a thyroid bioassay 24-72 hours post-iodination from REHS. The responsibility for scheduling this bioassay lies with the researcher. Failure to have the bioassay performed in the appropriate time frame will result in a Notice of Violation.

2. Reduction Procedures

[³H] Sodium borohydride is employed in the labeling of carbohydrates. It also has applications in organic synthesis to reduce aldehydes, ketones, acid chlorides and anhydrides, and in industrial application to reduce carbonyls, peroxides and metal ions, purification and removal of color, odor and oxidation precursors in organic chemicals.

REHS approves each applicant on an individual basis. REHS will review the protocol and observe each applicant during a “dry-run”. As part of the approval process, each applicant is responsible to:

- Submit a baseline urine sample to REHS prior to use (if more than 100 mCi of H-3 is to be utilized)
- Perform dry runs of the experiment to be performed (without radioactivity) to become familiar with the procedure
- Submit a copy of the procedure to be followed including vendor to REHS
- PROCEDURE NOTES: Containers should be tightly closed; volatility is enhanced at high pH. The applicant shall include estimated rates of incorporation.
- Submit the room location and the desired hood for review
- PROCEDURE NOTES: The hood must be vented directly to the roof and ideally be directly ducted and not ganged with other hood ducts. The hood shall have a demonstrated face velocity of 80 -100 linear feet per minute at a sash height of no less than 18 inches. The face velocity shall be determined annually and documented on the stickers affixed to each hood. This data will be used to calculate effluent data.
- Arrange for REHS to observe the last dry run. The reduction shall be performed with mock versions of all, solutions, equipment, etc., that are to be used in the “real” procedure.
- Upon successful completion, REHS will authorize the individual for this procedure
Work Place Preparation

Particular attention should be paid to glove selection and its chemical compatibility with the reagents involved. The following personal protective equipment is needed:

- Safety glasses
- Lab coat – disposable is recommended
- Double gloves

All procedures must be performed in an approved fume hood – a closed system may be employed depending on activity.

A post-experiment survey must be performed and documented immediately after the procedure.

The researcher may be required to submit a urine sample 12-72 hours post-reduction to REHS.

3. Other Common Uses Involving Potentially Volatile Sources

Experiment with commonly authorized radionuclides (S-35 methionine, H-3 as tritiated water and occasionally C-14 labeled organic solvents) may produce volatile materials. Any chemical or physical form that readily volatilizes or evaporates into the air must be considered a potential airborne risk. The researcher must be cognizant of this potential and plan the experiments accordingly and contact REHS for guidance. The RSC requires that all operations involving potentially volatile radioactive materials should be conducted in a properly operating fume hood. The University must tabulate and record the amount of radioactive emissions released to the environment each year. It is very important that if procedures have the potential to release airborne radioactive materials that REHS accounts for these releases.

S-35 Handling Procedures

The labeling reaction for S-35 methionine generates a methyl mercaptan reaction that liberates HCL and $^{35}$SO$_2$. With S-35 labeled amino acids the volatile component is very soluble in water; thus the water present in incubators used for cell culture can become contaminated, including the interior surfaces of the incubator. Incubators shall be included in the monthly contamination wipes performed by the lab and it is recommended they be checked for contamination after each use.

S-35 labeled amino acids should be thawed in a fume hood. It is recommended that they be vented using a charcoal packed syringe. These syringes are available from the vendor.

B. Procedures with Biohazardous Materials

If your laboratory generates mixtures of radioactive materials and hazardous biological agents, please be aware of the following:

Laboratories using human cells/tissues or potentially infectious microorganisms must submit a “Registration Form for Pathogens, Select Agents and Human Cells/Tissue” (Appendix K of the UMDNJ Laboratory Safety Plan) for approval by the RWJMS Institutional Biosafety Committee. A separate registration form is required for each pathogen used in the laboratory. The registration of biohazards is separate from the application to use radioactive materials; therefore, researchers should contact the RSO to discuss their intent to generate mixtures of radioactive materials and biohazardous agents. Additionally, researchers using biohazards must complete the Biological Safety Procedures Survey (Part 2 of Section 1.C of the UMDNJ Laboratory Safety Plan) and must attend Bloodborne Pathogens / Biosafety Training annually.
The biological component of mixed biological/radioactive wastes must be inactivated or decontaminated prior to removal by REHS. This inactivation step is critical because it greatly reduces the risk of infection for the REHS employees involved in waste handling and processing activities. Please refer to the Waste Disposal section of this guide as well as Part 10.F.3 of the UMDNJ Biosafety Plan (Section 10 of the UMDNJ - Piscataway/ New Brunswick Laboratory Safety Plan) for guidance regarding the inactivation of biohazards.

Copies of the UMDNJ Biosafety Plan and the biohazard forms mentioned in this section can be obtained online at the UMDNJ - EOHSS website or by contacting the UMDNJ - Piscataway/ New Brunswick Biological Safety Officer at 732-235-4058.
XI. **WASTE DISPOSAL PROCEDURES**

REHS provides radioactive waste removal, management and disposal services. The following is a description of the radioactive waste removal services provided by REHS. Radioactive waste is defined as any waste that is contaminated with or contains a radioactive material.

A. **DRY SOLID WASTE**

Dry waste consists of paper, gloves, plastic containers, and other forms of contaminated laboratory waste.

**Container Types**

- Dry waste can be collected in 30 or 55-gallon drums provided by REHS
- Dry waste may also be collected in waste containers purchased by the laboratory provided they meet the following criteria:
  - Containers must be rigid (e.g. plastic, metal or heavy gauge cardboard – bags alone are not adequate).
  - Containers must be double lined (REHS can provide plastic liners).
  - Containers must have a lid or cover.

**Container Labeling**

Dry waste containers should be properly labeled with:

- A radiation symbol
- The words “Caution Radioactive Materials” (see Appendix Q for an example)
- A properly completed Radionuclide Disposal Form (yellow cards) indicating the Authoree name, the date(s) waste was placed into the container, the radionuclide content of the waste and the activity present in the containers. These forms should be located near the containers such that it is apparent which container they are associated with.

**Waste Acceptance**

Dry waste containers should **not** contain the following:

- Free standing liquids
- Biohazardous material (BSL-1 or greater, see section entitled Biohazardous Waste)
- Biohazard bags
- Sharps (see section entitled Sharps)
- Metals
- >5% PVC (weight or volume)
- Sealed sources
- RCRA/TSCA hazardous wastes
- Explosives
- Pyrophoric materials

Do **not** commingle dry solid waste with other waste streams (liquid, liquid scintillation vials, animal carcasses/tissues).
Dry Solid Waste Segregation Scheme

Solid waste must be segregated based on half-life and according to the following scheme:

- Waste with half life ≤ 15 days (e.g. P-32)
- Waste with half life > 15 days and ≤ 120 days (e.g. I-125, S-35, P-33, Cr-51)
- Waste with half life > 120 days $^3$H and $^{14}$C only
- Waste with half life > 120 days other than $^3$H and $^{14}$C (e.g. Ca-45, Cl-36)

B. LIQUID WASTE

Liquid waste consists of freestanding liquids only, such as radionuclides dissolved or suspended in water, including solutions of proteins, buffers, cell media, etc.

Container Types

- Liquid waste should be collected in 1.0 or 2.5 gallon (~5 or 10 liter) polyethylene carboys provided by REHS
- Liquid waste may be collected in containers furnished by the laboratory provided they meet the following criteria:
  - Containers are plastic (not glass)
  - Containers have properly fitting lids (screw on)
  - Containers are stored in secondary containment
  - Containers are used with the understanding that they will not be returned for reuse

Container Labeling

- Liquid waste containers should be properly labeled with:
  - The radiation symbol
  - The words “Caution Radioactive Materials” (see Appendix Q for an example)
  - A properly completed Radionuclide Disposal Form (yellow cards) indicating the Authoree name, the date(s) waste was placed into the container, the radionuclide content of the waste and the activity present in the containers. These forms should be located near the containers such that it is apparent which container they are associated with.

Waste Acceptance

- Liquid waste containers should not be overfilled
- Do not commingle liquid waste with other waste streams (solid, liquid scintillation vial, animal carcasses/tissues)
- Liquid waste containers should be stored in secondary containment
- Liquid waste should have a pH between 6 and 9
  - Neutralization should be done as the last step in experimental procedures prior to disposal
  - If waste has been added to the container and has a pH range ≤ 2 or ≥12.5, please follow mixed waste procedures
  - Disinfect biohazardous material (BSL-1 or greater, see section entitled Biohazardous Waste)
Liquid Waste Segregation Scheme

Liquid waste must be segregated based on half-life and according to the following scheme:

- Waste with half-life ≤ 15 days
- Waste with half-life > 15 days and ≤ 120 days
- Waste with half-life > 120 days \(^3\text{H}\) and \(^{14}\text{C}\) only
- Waste with half-life > 120 days other than \(^3\text{H}\) and \(^{14}\text{C}\)

Drain disposal of radioactive liquid wastes is strictly prohibited in the laboratory. All liquid wastes must be offered to REHS for disposal.

C. MIXED WASTE

Mixed waste consists of waste that is radioactive and also has an additional hazardous component(s), (e.g. flammable, corrosive, reactive, and poisonous). Some common procedures performed in the laboratories which may generate mixed waste are: HPLC analysis, phenol / chloroform extractions, the use of certain liquid scintillation cocktails and precipitation reactions utilizing trichloroacetic acid. A list of non-hazardous scintillation cocktails is available in the Appendices. If mixed waste is currently generated in the lab and you have not contacted REHS, please do so immediately.

If you anticipate generating mixed wastes:

- Please contact REHS prior to the generation of mixed waste to help establish disposal procedures and waste minimization plans.

- Label mixed waste with:
  - The radiation symbol
  - The words, “Caution Radioactive Materials” (see Appendix Q for an example)
  - A properly filled out black and white “Hazardous Waste Label”
  - A properly completed Radionuclide Disposal Form (yellow cards) indicating the Authoree name, the date(s) waste was place into the container, the radionuclide content of the waste and the activity present in the containers. These forms should be located near the containers such that it is apparent which container they are associated with.

- Note all hazardous and non-hazardous constituents in Section III of the yellow Radionuclide Disposal Form.

- Mixed wastes may be extremely expensive to dispose. Waste minimization should be a critical component of your experimental protocols.

D. LIQUID SCINTILLATION VIALS

Container Types

- Liquid scintillation vials can be collected in 30 or 55-gallon drums provided by REHS

- Liquid scintillation vial waste can be collected in containers purchased by the laboratory provided that they meet the following criteria:
  - Container is rigid (capable of containing liquid)
  - Container has a capacity of 10 gallons or less
  - Container is double lined (REHS can provide plastic liners)
LSVs, if generated in small amounts, may be stored in the original cardboard tray that the empty vials come in provided that the tray follows all of the marking and labeling requirements of a waste container.

**Container Labeling**

Liquid scintillation vial waste containers should be properly labeled with:

- The radiation symbol
- The words “Caution Radioactive Materials” (see Appendix Q for an example)
- A properly completed Radionuclide Disposal Form (yellow cards) indicating the Authoree name, the date(s) waste was placed into the container, the radionuclide content of the waste and the activity present in the containers. These forms should be located near the containers such that it is apparent which container they are associated with.
- A properly filled out black and white hazardous waste label if the cocktail used is not on the “safe” cocktail list available in the Appendices

**Waste Acceptance**

- Do not commingle liquid scintillation vial waste with other waste streams (solids, liquids, and animal/biological)
- Do not place small vials of stock solutions with scintillation vials
- Vials containing residual fluids must be capped. If the liquid were to leak, it may degrade the plastic liner.
- Containers must not be overfilled; the lid must fit properly
- Use approved non-hazardous scintillation fluid unless otherwise authorized. A list of approved cocktails is available in the Appendices and on the REHS web site.
- Liquid scintillation vial waste containing $^3$H and $^{14}$C in concentrations greater than 0.05 microcuries/gram may require special consideration (roughly 1 mCi/30 gallon drum and 2.0 mCi/55 gallon drum). Please contact REHS if you plan on generating liquid scintillation vial exceeding these activities.
- If one vial has significantly more activity (~0.5 mCi or greater) than the rest of the vial waste, please keep it separate for pick-up.
- Yellow Radionuclide Disposal Forms should be marked with the name brand of the liquid scintillation cocktail.

**Liquid Scintillation Vial Segregation Scheme**

Liquid scintillation vial waste must be segregated by nuclide according to the following scheme:

- Waste with half life $\leq$ 120 days
- Waste containing only $^3$H and/or $^{14}$C
- Waste with half life $>$ 120 days other than $^3$H and $^{14}$C

Note: Please attempt to keep the total activity of waste in any liquid scintillation vial drum to less than 2 mCi. If you need to exceed this limit, please inform REHS.

**E. ANIMAL CARCASSES AND TISSUES**

Animal carcasses and tissues must remain frozen prior to disposal. REHS has limited storage capacity for this waste type. The Authoree shall have facilities to accommodate the full volume of his/her anticipated waste for at least three months.

**Container Types**

- Animal carcasses and tissues may be stored in freezers in sealed double bags.
Container Labeling

- Animal carcass/tissue waste containers should be properly labeled with:
  - The radiation symbol
  - The words “Caution Radioactive Materials” (see Appendix Q for an example)
  - A properly completed Radionuclide Disposal Form (yellow cards) indicating the Authoree name, the date(s) waste was placed into the container, the radionuclide content of the waste and the activity present in the containers. These forms should be located near the containers such that it is apparent which container they are associated with.

Waste Acceptance

- Do not commingle animal carcass/tissue waste with other waste streams (solids, liquids, liquid scintillation vials)
- Keep animal carcasses and tissues frozen until removal by REHS personnel
- Prevent sharp edges from puncturing the bags
- Animals contaminated with $^3$H and $^{14}$C at a concentration less than 0.05 microcuries per gram can be disposed of as non-radioactive by REHS. When the radioactivity is concentrated in certain organs, these parts can be removed for radioactive waste disposal as tissues, and the remaining carcass can be treated as non-radioactive waste if the remaining activity for $^3$H and $^{14}$C is less than 0.05 microcuries per gram.
- Animals containing nuclides with a half-life of less than 120 days will be held for decay to background
- Animals that are known to contain active pathogens, as well as radioactive materials, must receive special attention; REHS must be notified

Animal Carcass/Tissue Segregation Scheme

Animal Carcass/Tissue waste must be segregated by half-life according to the following scheme:

- Waste with half-live < 120 days
- Waste containing only $^3$H and/or $^{14}$C
- Waste with half live > 120 days other then $^3$H and $^{14}$C

F. **BIOHAZARDOUS WASTE**

Radioactive waste that contains biohazardous agents (i.e. Biosafety Level 1 or greater) must be biologically decontaminated prior to REHS pick-up. Some general guidelines are provided below, but many laboratories have unique protocols so these recommendations will not fit every situation. Please contact the RSO or the Biological Safety Officer (BSO) to discuss specific mixed biological/radioactive waste questions.

- Do not autoclave mixed biological/radioactive waste. Radioactive materials are not permitted in campus autoclaves. *If steam sterilization is the only acceptable method for inactivation of your biological agent, please contact the RSO or BSO prior to starting your experiment.*

- Chemical disinfection is the preferred method for inactivating biohazards in both solid and liquid biological/radioactive waste. After inactivating the biohazard, the waste can be placed in radioactive waste containers.
• Consult Part 10.F.3 of the Biosafety Plan (Section 10 of the UMDNJ - Piscataway/ New Brunswick Laboratory Safety Plan) for disinfectant options, and choose a disinfectant that is chemically compatible with the waste materials being treated.

• ** WARNING ** Toxic gas can be released by mixing incompatible chemicals such as bleach and ammonia or bleach and iodine.

• Solid items that have been soaking in disinfectant solution should be dried completely before disposal in radioactive waste drums. Laboratory fume hoods may be used for drying solid items; please notify the RSO if items containing volatile radioisotopes (e.g. $^{125}$I or $^{35}$S-methionine) are being dried in your hood.

• Liquid disinfectant solutions used for biological/radioactive waste should be handled according to the liquid radioactive waste rules

• Write the chemical(s) used for disinfection on the Radionuclide Disposal Forms (yellow cards)

• Do not attempt to decontaminate sharps that contain both biohazards and radioactive materials (see section entitled Sharps)

G. SHARPS

Sharps consist of any sharp object contaminated with radioactive materials (see list below)

• Sharps must be collected only in approved sharps containers
• Do not cap syringes before placing in the sharp containers
• Sharps containers must be sealed and properly labeled as radioactive waste
• Sharps containers should be presented for disposal as radioactive waste. Do not place sharps containers into solid waste containers.
• The generator is responsible for purchasing sharps disposal containers
  • Please ensure all biohazardous symbols and words are crossed out if no such hazard is present
• The presence of loose sharps intermixed with dry waste represents a great hazard to REHS personnel and constitutes a serious violation that could result in the revocation of the Authoree’s permit

• Sharps include the following items:
  • Hypodermic needles
  • Syringes (including those without needles)
  • Pasteur pipettes
  • Scalpel blades
  • Blood vials
  • Culture dishes
  • Slides
  • Cover slips
  • Broken glass
  • Needles with attached tubing
H. RADIONUCLIDE DISPOSAL FORMS (YELLOW CARDS)

The terms of the University’s license requires detailed records of receipt, use and disposal of radioactive materials. All radioactive materials must be accounted for. To facilitate the tracking of radionuclides, a radionuclide inventory log should be kept for each nuclide used. Always make sure that the total activity in the lab does not exceed the maximum possession limit for that radionuclide. Always compute the balance on hand (mCi). This information is essential for the completion of the yellow disposal cards.

A yellow Waste Disposal Form shall accompany each container of radioactive waste. If multiple authorees share a single container, it is important that one card for each laboratory be present on the container. Disposal cards should be completed as waste is placed into the container. Do not wait until the waste container is full to complete the disposal card. Please fill in all the required information with careful attention to the following:

Section:  I

PI Name:  Name of the authorized user
PI. #:  4-digit number assigned to the Authoree
Bldg:  Building in which waste is located
Room #:  Number of the room in which waste is located
Campus:  Campus on which waste is located
Pick Up Date:  To be completed by REHS upon removal
Isotopes:  List all isotopes that are in the container
Waste Type & Container Volume:  Check type of waste, i.e. solid, sharps, liquid aqueous, liquid organic, biological/carcass or liquid scintillation vials; and size of container, i.e. 30 gal, 55 gal, etc.

Section:  II

Date:  Date radionuclides were placed into the container
Isotope:  Radionuclides present in the container
Chemical Name/Form:  Name of the radiolabeled chemical and general chemical family to which the radiolabeled chemical belongs
Activity:  Radioactivity (mCi) contained in each waste entry

Section:  III

Total:  Activity totals for each radionuclide entered in Section II
Other Isotopes:  Activity totals for other radionuclides not listed
Liquid/LSV Wastes:  List non-radioactive chemical constituents (in liters) that is in the liquid waste. Calculate the percent volume. List the type of scintillation cocktail used in this section.
Authoree Signature:  Signature of laboratory employee who is responsible for collection of radioactive waste.
Things to remember while completing Waste Disposal Form (yellow cards):

- Do not perform any correction for decay
- Enter the activities in millicuries (mCi)
- Clearly state the chemical name and chemical form of the radiolabeled chemical (Section II)
- List each chemical component; other than radiolabeled chemicals recorded in Section II, and its percentage (Section III). Remember that the objective is to identify mixed waste, e.g., waste that is both hazardous and radioactive. This is especially important for liquid waste.
- For liquid scintillation vial waste indicate the brand name of the liquid scintillation cocktail
- The forms should be located near the containers such that it is apparent which container they are associated with
- Do not forget to sign the card
- Keep the card clean and avoid contamination
- Unless the disposal cards are properly completed, REHS personnel will not pick up the radioactive waste.

I. REQUEST FOR RADIOACTIVE WASTE REMOVAL

Removal of radioactive waste takes five to ten working days from the date of request, depending on your location. Please plan accordingly. When you contact REHS, have the following information ready.

- Authorizor name and number
- Building and room where waste is stored
- Type of waste (dry, liquid, vials, animal)
- Radionuclides present in waste
- Yellow disposal ticket numbers
- Number and size of containers

To request a radioactive waste pick-up contact REHS at 732-445-2550 or submit a request for radioactive waste disposal via the REHS website.
XII. SEALED SOURCES & GENERALLY LICENSED DEVICES

Sealed sources are radioactive sources that are encapsulated in some form of housing such that a release of radioactive material is highly unlikely under normal conditions. For this reason, many of the policies and procedures regarding contamination control are not required. However, many sealed sources have relatively large activities and therefore may present a significant source of external radiation exposure and must be handled with care. Generally, sealed sources are regulated under the University’s NRC or NJDEP license.

Generally Licensed Devices (GLDs) are devices that contain a radioactive source and are available to the general public for purchase without a specific license from the NRC or NJDEP, hence the term “generally-licensed”. These devices have safety features engineered into the design and direct handling of the radiation source is not possible under normal operating conditions.

Examples include:

- Smoke detectors
- Gas chromatographs with electron capture devices
- Self-luminescent exit signs
- Liquid scintillation counters
- Static eliminators for balances

A. REQUIREMENTS

Possession of any sealed source requires the appropriate authorization from the RSC and REHS. Users must attend training, sources must be labeled, and security must be in place. It is the Author ee’s responsibility to ensure that the sources are used according to the regulations. REHS must be notified whenever a sealed source is purchased, transferred, relocated, or disposed.

B. SEMI-ANNUAL LEAK TESTS

Sealed sources must be inspected and tested for leakage under the supervision of REHS at six-month intervals or as specified in the license under which they were acquired.

C. LABELING REQUIREMENTS

Sealed sources and/or equipment containing sealed sources or GLDs must be properly labeled. See Appendix Q, Common Postings & Labels, for examples. Please notify REHS if you have sealed sources or GLDs that are not properly labeled or if the existing labels have been compromised.
XIII. RADIATION PRODUCING MACHINES

A. AUTHORIZATION FOR USE

For the purposes of this section, the term “radiation-producing machine” refers to x-ray machines of the standard diagnostic and therapeutic types, x-ray diffraction units, x-ray crystallography units, electron microscopes, particle accelerators, and high voltage rectifiers with voltages exceeding 20 KeV. The NJDEP regulates the use of radiation-producing devices.

Any person who wishes to be an authoree (one who has administrative control of and responsibility for, a radiation-producing unit) must first complete the “Application for Authorization to Use a Radiation-Producing Machine”. The application is available in the Appendices and on the REHS website. The completed form may be sent by campus mail or faxed to REHS. After receipt of the application, REHS will contact the applicant to set up an appointment to discuss the rules and regulations for radiation producing machines.

B. ACQUISITION AND INITIAL INSPECTION

REHS must be notified prior to the acquisition of any radiation-producing machine to ensure adequate facilities and trained personnel are available. After receipt of a radiation-producing machine and prior to its use, REHS will schedule an appointment to inspect and survey the unit. The initial inspection will include (but is not necessarily limited to) the following:

- Survey for radiation leakage
- Testing lights for fail-safe characteristics
- Issue dosimetry
- Assess training compliance of all users
- Evaluate the operating manual and/or SOP
- Creation of log book
- Assess alignment SOP and approval of qualified individuals (if applicable)
- Interlock checks
- Security of unit
- Safety of unit
- Posting of appropriate signs and labels

REHS will interpret the NJDEP regulations and provide assistance with compliance. Upon completion of training and a satisfactory inspection, REHS will register the unit with the NJDEP and grant authorization to the applicant. The authorization permits only the use of the specific machine identified in the application and only in the location for which the initial inspection was made. If the authoree wishes to obtain additional units, he/she will need prior approval from REHS. Any new units under the Authoree’s permit will require an initial inspection of the unit as outlined above. REHS will provide dosimetry for new users and perform exchange of same each quarter.

C. AUTHOREE RESPONSIBILITIES

The authoree for a radiation-producing machine has the following responsibilities to satisfy NJDEP regulations and University policies:

- Under the direction of REHS, ensure that the radiation-producing machine meets all requirements of the NJDEP regulations
- Cooperate with REHS to conduct semi-annual (or annual in the case of electron microscopes) inspections of the radiation-producing machines under his/her authorization
- Correction of any non-compliance issues noted during inspection
- Ensure proper use and exchange of dosimetry (e.g. whole body and extremity badges) for persons assigned to his/her authorization*
- Ensure all users of radiation producing machines are in compliance with training requirements
- Maintain a user log including names, dates and times of use
• Provide and maintain a written, detailed SOP for the safe operation of the unit and ensure that it is available to each user. Ascertain that all users are properly trained in the use of that specific unit.
• Provide and maintain a written, detailed SOP for alignment procedures (if applicable). All users who perform alignment must be approved by REHS.

*Please note that if badges are not exchanged for 2 cycles for any particular person, the authoree may be required to pay for the quarterly charges and lost badge fees (as charged by the dosimetry vendor).

The authoree should notify REHS immediately in the following circumstances:

• If an over-exposure to radiation is indicated or suspected
• Upon failure of an interlock or fail-safe device
• Before any machine is moved, disposed or transferred
• When change in experimental design could result in significant radiation exposure or hazard
• If there are new workers in the lab who wish to use the unit
• If there is a new person who wishes to perform alignment and/or if there is a new alignment procedure

Training consists of successful completion of the Rutgers/RWJMS Online X-Ray Training provided by REHS through our web site. The Authoree and his or her authorized users will be required to complete the training and quiz prior to operation of any radiation-producing machine. Once the REHS training is complete, the user will need to complete a badge application (available on the REHS web site). Additionally, the Authoree is required to provide hands-on, unit-specific training for each user.

D. RELOCATION AND/OR REPAIRS

The NJDEP requires notification and a re-survey of any unit that is moved. Prior to relocating a radiation-producing machine, the authoree should contact REHS for approval. Once the unit is approved for relocation, it will be subject to an initial inspection as outlined in the above procedure. If any unit is repaired or modified, the authoree is required to call REHS to re-survey the unit. Prior to disposal or transfer of any radiation-producing machine, the authoree must contact REHS for the appropriate instructions.

E. INSPECTIONS AND ENFORCEMENT

Upon completion of bi-annual (or annual) inspections, REHS will send each Authoree a copy of the inspection report. Any issues of non-compliance will be noted on these reports. The Authoree is expected to correct any issues in a timely manner. If the inspector notes any major non-compliance issues, and/or repeat minor non-compliance issues, an NOV may be issued. A written response is required, within two weeks, outlining the corrective measures taken by the Authoree. If two NOVs are issued within 3 inspection cycles, a management meeting may be required, at the discretion of the RSC. A management meeting will include the Authoree and at least two of the following: RSO, and a member(s) of the RSC. If at any time, the unit is deemed to pose an immediate safety hazard, REHS will prohibit the use of the unit until corrective actions have been taken.

An Authoree, who knowingly allows an individual to use a unit that poses an immediate safety hazard or fails to prevent the use of the unit via adequate administrative controls, will have his/her authorization suspended pending a management meeting.

Major non-compliance issues are defined below:

• Disposal or relocation of a radiation-producing machine without notifying REHS
• Failure to comply with REHS requests to repair or add warning lights
• Use of a unit that has not been inspected by REHS
• Failure to report the acquisition of a new or transferred radiation-producing machine
• Use of a unit that has been classified as “in storage-out of use” without prior notification to REHS
• Unauthorized individuals performing alignment without prior approval of REHS
• Use of a unit by personnel who have not been trained and/or have not obtained dosimetry
Examples of a minor non-compliance issue are:

- Non-compliance with REHS requests to perform bi-annual (or annual) inspections
- Failure to keep and/or use a written log book
- Failure to produce an operator’s manual and/or a written SOP for the unit
- Failure to provide a means to prevent unauthorized use (e.g. – unlocked door or keys left in unit)
- Dosimetry is not worn consistently when operating the unit
- Sharing of radiation badges

If an authoree or user does not understand any of the policies noted above, please contact REHS for clarification.

To: Pregnant Radiation Workers

From: Deborah Hrabinski
Health & Safety Specialist

Re: Fetal Dosimetry Program

Please fill out this form if you wish to declare your pregnancy. REHS will issue a fetal radiation badge to all pregnant workers who either work with radiation or are concerned because they work in a radioactive materials lab. These badges must be worn at waist level at all times while you are in the controlled area. They will be exchanged on the first of every month (or the first business day thereafter).

Please fill out all of the information below and return this form to REHS via campus mail or fax at 732-445-3109. If you have any questions, please feel free to call Deborah Hrabinski at 732-445-2550. All information concerning your pregnancy will be kept confidential.

FETAL DOSIMETRY PROGRAM

<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

VI. INTENDED USE OF RADIOACTIVE MATERIAL: Use supplementary sheets to provide sufficient detail for evaluation of the health hazards and possible building contamination.

- Include a description of the experimental objective, methodology, the chemical and physical properties of the radionuclide or its compounds; attach copies of experimental protocols.
- Describe what methods will be used to prevent internal radiation exposure, minimize contamination, and minimize external radiation exposure.
- Describe the types of radioactive waste that will be generated. Specifically list the chemical constituents of liquid waste streams.

Signature of Applicant ___________________________ Date ____________

Signature of Department Head _______________________ Date __________

Your application will be reviewed promptly and REHS will be contacting you shortly to arrange an interview at your laboratory. During the interview, REHS will review the lab space for suitability and the radiological aspects of your proposed work. All radioactive material work must be performed in accordance with the University’s Radiation Safety Guide. A copy of this guide will be given to you at the interview; however, you may also view this guide at http://rehs.rutgers.edu. Click on Radiation Safety and select the appropriate guide.
APPENDIX D
APPLICATION FOR USE OF RADIATION PRODUCING MACHINES

Check Affiliation:

VI. INTENDED USE: Use supplementary sheets to provide sufficient detail for a basis of evaluation.

- Attach a copy of the Standard Operating Procedure (SOP) for the unit (step by step instructions on how to operate the unit).
- If alignment will be done by authoree or authorized person, please attach SOP for alignment.

Signature of Applicant ___________________________ Date ____________

Signature of Department Head _______________________ Date ____________

Your application will be reviewed promptly and REHS will be contacting you shortly to arrange an interview at your laboratory. During the interview, REHS will review your application, discuss your objectives, and perform an initial inspection of the unit.

All work must be performed in accordance with the University’s Radiation Safety Guide. A copy of this guide will be given to you at the interview; however, you may also view this guide at http://rehs.rutgers.edu. Click on Radiation Safety and select the appropriate guide.

R.E.H.S.  
Your Radiation Dosimeter – Rules & Limitations

Dear Researcher,

According to the regulations outlined by the Nuclear Regulatory Commission (NRC) and/or the New Jersey Department of Environmental Protection, Rutgers University and RWJMS are not required to provide dosimetry (radiation badges) to the vast majority of researchers working with radioactive materials (RAM). That said, we do provide dosimetry to a select population at each university. For example; those who work with high energy beta emitters, select gamma emitters, and some machine sources. You have met our internal criteria for dosimetry, or have chosen to reimburse REHS for dosimetry costs. Enclosed you will find your radiation badges. Your dosimeter is designed to monitor your occupational exposure. Please make sure you understand the rules and limitations (outlined below) of these dosimeters. Dosimeters are exchanged every three months in the beginning of January, April, July and October. Fetal dosimeters are exchanged on the first of every month (or the first business day thereafter). If you have any questions or concerns, please contact Debbie Hrabinski at 732-445-2550 or dhrabinski@aps.rutgers.edu.

Radiation Badge Rules:

- **Do not share your badge.** Your dosimeters are assigned to you and any dose received by the badge will be recorded under your name and kept as a permanent record. If someone in your lab needs a badge, please contact REHS and a spare badge can be issued as needed.

- **Do not deliberately expose them to radiation.** If you think your badges were exposed to radiation inadvertently, please contact REHS for instructions. When you aren’t wearing them, keep them where their exposure will be minimal or as close as possible to background radiation levels (such as your desk or an area of the lab where RAM is not used). Do not bring them to the doctor or dentist office since these medical procedures are not “occupational exposures”.

- **Wear them appropriately.** Whole body badges measure your deep and shallow doses. They should be worn under your lab coat on the torso between the neck and pelvic area. Ring badges measure extremity doses. They should be worn under your gloves on the finger of the hand which you do most of your radiation work (or the hand nearest to the radiation source).

- **Return badges on time.** Your badges cannot be read if they are not exchanged on time. When you receive your new quarter’s badges by campus mail, please return the old badges promptly to REHS.

- **Notify REHS if your badge is lost.** A replacement can be issued anytime during the quarter if your badge is lost or missing. REHS incurs charges for non-returned whole body and ring dosimeters at a cost of $9 and $5 respectively.

- **Do not expose badges to heat.** Do not leave your badge anywhere that it can be exposed to heat such as the window sill or inside a hot car. Exposures recorded on the dosimeter may be erased by excessive heat exposure.
Radiation Badge Limitations:

- **Dosimeters are a passive device.** Your dosimeter gives an estimate of the amount of external radiation that you were exposed to. They do not absorb radiation, nor do they help you in any way against the effects of radiation. The results of your dosimeter exposures get reported to REHS several weeks after they are returned to the vendor. Your radiation badge is purely for the purposes of monitoring the amount of radiation you may have been exposed to during your occupational work so that you do not exceed the levels set forth by the NRC.

- **They have a minimum detectable level.** Your radiation badge cannot record doses below 10 mrem. If you receive a badge report with “ND” as the reportable dose, this means that the dose received was “non-detectable” (or less than 10 mrem) by the dosimeter. Your badge will not record doses from radioisotopes such as H-3, C-14 or S-35 because the energies of these radionuclides are too low for the dosimeter to record. They work best with higher energy beta emitters such as P-32 or gamma emitters like I-125 or Cr-51.

- **Dosimeters will record any radiation exposure.** The small quantities of radioactive material used in a university setting such as ours, are not usually recorded on our dosimeters. Likewise, if this small quantity of radioactive material is taken into the body, these internal doses will not be recorded. If you suspect that you received an internal radiation dose, contact REHS immediately. Internal exposures can be avoided by carefully planned and executed experimental procedures, including the use of proper personal protective equipment (i.e., lab coat, gloves, safety glasses). The use of a hand-held survey meter such as a Geiger counter can help you avoid any internal exposure by identifying potential areas of contamination before you get a personal exposure. If you have had a medical test such as a nuclear medicine scan or stress test, you should not wear your badge, since these tests usually involve gamma-emitting radionuclides. The radioactive material used for these medical procedures will record a potentially high dose on your dosimeter. These medical tests are not occupational doses. Please contact REHS if you’ve had one of these procedures. If your badge is stored near radioactive materials or a radiation source, likewise it will record a dose that is not reflective of your occupational exposure.

Your dosimetry report is sent to you once a year via a Form 5. The Form 5 has your dose history for the previous year. If you do not receive a Form 5 (in March of the following year), that means your doses were “ND” (non-detectable). You may request a copy of your quarterly dose report at any time throughout the year. Contact Debbie Hrabinski at REHS for a copy of this report.

Our goal is to keep your dose ALARA (as low as reasonably achievable). By following these rules and understanding the limitations of your dosimeter, unnecessary radiation doses can be avoided. If you do not meet our badge requirements (see our web site at http://rehs.rutgers.edu), or your radioactive material work has changed and a dosimeter is no longer needed, please send a note along with your badge by campus mail to Debbie Hrabinski at REHS. Thank you for your anticipated cooperation with the dosimetry program!
Efficiency/MDA Calculations

The University is required to determine the counting efficiency and minimal detectable activity (MDA) of liquid scintillation and gamma counters in order to properly evaluate wipe test results. Monthly laboratory wipe tests must be recorded in units of disintegrations per minute (dpm) as per NRC regulations. To ensure compliance, the following procedures must be performed monthly for, at a minimum, the least efficient isotope that is used in the lab.

A. Determination of Efficiency (E):

a. Use a standard of known activity. Remember that 1 uCi = 2.2 x 10^6 dpm.

b. Set the gain and discriminator levels (windows) according to the manufacturer’s recommendation for the isotope to be counted.

c. Count a blank (background) and the standard for one minute to obtain counts per minute (cpm) for both.

d. Determine the net cpm of the standard by subtracting the background cpm from the standard cpm.

e. Calculate the efficiency (E):
   \[ E = \frac{\text{net standard cpm}}{\text{activity of standard in dpm}} \]

f. Divide cpm of wipe samples by the efficiency to convert to dpm.

B. Determination of the Minimal Detectable Activity (MDA):

a. Count the blank (background) for one minute

b. Calculate the MDA:

   \[ \text{MDA (cpm)} = 4.65 \sqrt{\text{background (cpm)}} \]

c. To obtain results in dpm, divide the MDA by the efficiency

d. Record all calculations and results in the lab notebook with the monthly lab wipes. The MDA of the counting instrument should be less than 100 dpm. If not, please notify REHS.

__________________________________________________________________________
REHS REVIEW

Review should address the following where applicable:

- Release criteria for housing/cages
- Disposal of experimental wastes, bedding, unused food and water
- Training of research and vivarium staff
- Does permit authorize in-vivo work?
- Does the PI/applicant have previous experience with RAM and in-vivo protocols?
- Does protocol outline new or novel experiments not previously used?

Recommendation to RSC:
- Approve
- Reject
- Approve pending: __________________________________________________________________
- Table pending: __________________________________________________________________

cc: IACUC or ACFC chair, PI, RSC

Transfer of Radioactive Material

RUTGERS ENVIRONMENTAL HEALTH AND SAFETY

27 Road 1
Building 4086 Livingston Campus
Piscataway NJ 08854
732-454-2550 phone
732-445-3109 fax
http://rehs.rutgers.edu

INSTRUCTIONS:

• Research staff may transfer radioactive material to another authorized permit
• Research staff are PROHIBITED from transporting radioactive material by vehicle
• Transfer requests must be submitted to REHS prior to the transfer
• Fax this form to REHS at 732-445-3109 or use the web version at http://rehs.rutgers.edu/

| Alternate Contact: | |
|--------------------| |

Contact REHS at 732-445-2550 with any questions or problems.
Inspection Checklist Explanation

The following document explains the items found on the quarterly radiation safety inspection checklist used by REHS. You should receive an emailed copy of your inspection checklist after each radiation safety inspection. Please be aware that items marked with an X for “unsatisfactory” should be corrected immediately. Should you receive a Notice of Violation (NOV) as a result of this inspection, you are required to respond in writing. If you have any questions, please contact Patrick McDermott, Radiation Safety Officer at 732-445-2550 or by email at mcdermot@rehs.rutgers.edu. Most forms and information about radiation safety can be found on our web site at http://rehs.rutgers.edu.

LAB(S): The rooms listed under your authorization that are approved for radioactive material (RAM) work and subject to inspection.

SECURITY: All RAM must be secured. At Rutgers this can be accomplished by locking the lab, locking the refrigerator or freezer where RAM is stored, storing RAM in a lock box, or by challenging any one who walks into the lab. At UMDNJ security shall be accomplished by locking stock RAM (using a lockbox or installing a lock on the refrigerator, freezer) when it is not in use or under direct surveillance and; locking labs that store RAM or waste when they are unattended and; by challenging anyone who walks into the lab.

CAUTION SIGN: All doors into RAM labs must be posted with a sign that has the radioactive warning symbol and the words “Caution – Radioactive Materials”. Additionally, it lists other hazards the lab may contain and emergency contact information for the lab.

4 POSTINGS: REHS will check for the presence of the four required postings in the lab and replace any that are missing, torn, or out of date. These include: 1) The NRC Form 3 (Notice to Employees), 2) NJDEP Notice to Employees, 3) REHS Radioactive Material Laboratory Safety Rules, and 4) the REHS Caution Sign which lists our NRC License Numbers and applicable regulations.

MONTHLY WIPES: All labs must perform a wipe test for contamination in any month that radioisotopes are used. All wipes must be expressed in units of dpm, not cpm. The counter printout sheet (including the date) should be attached to the monthly wipes. A detailed map of the wipe area should be present. Areas of contamination greater than 100 dpm above background must be cleaned, re-wiped, and documented in the monthly wipe book.

MDA/EFFICIENCY: Calculations of Minimum Detectable Activity (MDA) and efficiency must be performed and documented monthly. MDA should be less than 100 dpm. An excel spreadsheet that will auto-calculate these numbers can be downloaded from our web site.

DAILY SURVEYS: Both a personal survey and a survey of the work area must be performed with a survey meter after every use of radioactive material. These surveys must be documented a minimum of once per day. The personal survey should include hands, shoes, clothing etc. A work area survey should include floors, equipment used, and the regular trash container.

SURVEY METER: Survey meters are evaluated to make sure the survey instrument owned by the lab is appropriate for the radioisotopes used (i.e. a pancake GM or NaI probe).

METER OPERATIONAL: REHS will verify that the survey meter used for daily surveys is in working order, that it responds to a known source of radiation, and that the efficiency of the meter has been checked by REHS within the past year.
**WASTE LABELLED:** All radioactive waste containers must be labeled with a radioactive sticker and must have a yellow waste card associated with them indicating the isotope and approximate activity. A temporary waste container should be labeled with a radioactive sticker and either emptied at the end of the day or have a yellow waste card associated with it. If the lab supplies their own containers, appropriate containers must be utilized.

**SECONDARY CONTAINMENT:** All liquid radioactive waste containers must be placed in secondary containers capable of containing the entire volume of radioactive liquid in the event of a leak. Proper storage of the container with the lid tightly closed is important. Funnels should not be left in the opening of the waste container.

**PROPER SEGREGATION:** Radioactive waste must be segregated according to isotope half-life. See our website for segregation schemes. **Drain disposal of liquid radioactive waste is prohibited.**

**YELLOW WASTE CARD:** Any radioactive waste container must have a yellow waste card associated with it. All sections should be filled out. Section I lists the Authoree information such as name, 4 digit PI number, the building and room number where waste is located. Section II is filled out each time RAM is placed into the container. Section II is filled out if the waste is liquid. List the ingredients of the liquid waste so that the total volume = 100%. For LSV waste, the type of scintillation cocktail must be filled out in this section.

**EAT/DRINK/SMOKE/COSMETICS:** Eating, drinking, smoking, and applying cosmetics in the labs are prohibited. Food shall not be stored in RAM labs. Evidence of food consumption, such as food wrappers in trash cans, will result in a Notice of Violation (NOV).

**RAM PRACTICES:** The lab should have dedicated RAM work areas that are sectioned off from general work areas. Lab personnel should ensure the safety of visitors and non-rad workers by labeling RAM use areas and using general lab safety practices. Personal protective equipment (PPE) must be worn when handling RAM. This includes double gloves, buttoned lab coats and safety glasses. Short, skirts, and open toe shoes should not be worn when handling RAM.

Shielding should be used if necessary. Radiation badges, if issued, must be properly worn when working with radioactive materials. Badges must not be lent to others or stored near sources of radiation. After RAM is delivered, the package and inner vial should be checked for contamination (the SOP for package receipt is posted on our website). Before boxes are put in regular trash, any radioactive symbols should be defaced. Lead should be wipe-tested and meter-surveyed for contamination and shipped to a recycling center. Please see our web site for lead disposal guidance.

**TRAINING:** All individuals, who work with radioisotopes, including Authorees, must attend an initial radiation safety orientation and refresher training every calendar year thereafter. Visit the REHS website to complete the online refresher training or to find dates for in-person training sessions.

**INVENTORY:** Each lab shall keep a written inventory of radioisotopes received and disposed. Inventory log sheets are provided with each RAM package REHS delivers. These forms are pre-printed with the vial information. Blank copies of the inventory-tracking sheet can be found on the REHS web site. Additionally, Inventory Verification Reports (IVRs) are emailed to each Authoree every quarter for confirmation that receipt and disposal amounts are correct. If the IVR is not returned within 2 weeks, the Authoree could be subject to suspension of RAM delivery.

**RADIATION SURVEY:** REHS will perform a thorough meter survey of the lab in order to detect contamination. Lab personnel and/or the Authoree will be notified immediately if contamination is found.
APPENDIX J

### Notify REHS of Intended Change - check all that apply:
- [ ] Moving radioactive material research to new lab space
- [ ] Lab is being vacated/renovated
- [ ] PI is leaving the University
- [ ] Other ____________________________________________

### Radioactive Waste
Arrange for removal of all radioactive wastes. You can request a radioactive waste pickup at [http://rehs.rutgers.edu](http://rehs.rutgers.edu) or by calling 732-445-2550. Carefully review the inventory to ensure all waste is accounted for.

### Radioactive Materials - Unsealed
Stock radioactive materials can be prepared and transported by REHS upon request. Lab staff are prohibited from transferring or transporting radioactive material without REHS approval.

### Radioactive Materials - Sealed Sources
Federal (NRC, DOT) and State regulations specifically require REHS to supervise the relocation or transfer of all radiation sources. Notify REHS in advance if a liquid scintillation counter or a gas chromatograph with an electron capture detector needs to be moved, transferred or disposed.

### Labeled Equipment
All equipment posted “radioactive” must be surveyed
- Wipe test results: \(< 100 \text{ dpm/100 cm}^2\) **AND**
- Meter survey results \(< \text{ or } = \text{ background measurements} \)
- THEN Remove/Deface “radioactive” postings

If the wipe test **OR** meter survey results exceed the criteria
- Decontaminate and re-survey
- Contact REHS if you cannot decontaminate

### Freezers
Accumulated ice in freezers used to store H-3 or C-14 should be sampled and analyzed for contamination. Contact REHS for guidance.

### Lab Survey
Perform a wipe test of the laboratory. Decontaminate and re-survey any area exceeding 100 dpm/100 cm². Fax the results to REHS.

APPENDIX M
Post Iodination Survey Form

REHS Policy requires that a contamination survey be conducted immediately after an iodination is performed. This survey must be performed with wipe tests on bench tops, floors, instruments, and anything else that could have been contaminated during this procedure. Personal surveys of lab coats, shoes, hands, face, etc, can be conducted using a calibrated low energy NaI probe in a low background area or use wipes as above.

Wipe Tests

- Any survey result above 100 dpm/100cm² shall be decontaminated and re-surveyed.
- Any personal contamination above background must be reported to REHS

By signing below, you are confirming that you have performed the above survey and that any contamination found has been cleaned below applicable limits. When you have your thyroid bioassay, please give this completed form to REHS.

APPENDIX O
Radiation Survey Meters

Radiation meters are used to detect ionizing radiation. All laboratories working with radioactive materials must possess a survey meter with an appropriate detector. The following information is intended to help you make an appropriate purchase.

Radiation Detector Types

<table>
<thead>
<tr>
<th>Geiger Mueller (GM) – “Pancake”</th>
<th>Sodium Iodide (NaI)</th>
</tr>
</thead>
<tbody>
<tr>
<td>• For detection of Beta Emitters</td>
<td>• For detection of Gamma Emitters</td>
</tr>
<tr>
<td>• Cannot detect H-3</td>
<td>• Detects radiation via the interaction of ionizing</td>
</tr>
<tr>
<td>• Detects radiation via the ionization of a gas contained inside</td>
<td>radiation with a scintillating crystal containing</td>
</tr>
<tr>
<td>the probe. The ejected electrons are then collected and</td>
<td>Sodium Iodide(NaI).</td>
</tr>
<tr>
<td>counted.</td>
<td>• Laboratory MUST obtain a NaI probe when working with I-125.</td>
</tr>
<tr>
<td>• Probe has a very thin membrane that is under pressure and</td>
<td></td>
</tr>
<tr>
<td>easily punctured.</td>
<td></td>
</tr>
</tbody>
</table>

| Commonly used to detect: C-14, Ca-45, P-33, S-35, P-32     | Commonly used to detect: Cr-51, I-125                     |

Purchasing a Meter
The Geiger Mueller and NaI probes or detectors can be interchanged and attached to the same survey meter. The Ludlum Model 3 is the most common meter and is a very reliable instrument.

Ludlum Vendors
- Atlantic Nuclear (http://www.atnuke.com)
- Ludlum Instruments (www.ludlums.com)

Other Vendors
- Thermo Electron (Bicron, Eberline), WB Johnson

Once a new meter is received, contact REHS to have an efficiency check performed and added to the REHS database.

Calibrations/Repair
Laboratory meters are checked by REHS annually. REHS checks the efficiency of the meter against a known P-32 and C-14 check source for pancake probes, and an I-129 source for NaI probes. If the meter fails the efficiency check, REHS can try to resolve the problem in-house, but may need to send it back to the appropriate vendor for repair. The lab is expected to cover the cost of any repairs to a meter should the need arise.
Radiation Producing Machine
Action Request Form

Instructions:

- This form must be submitted to REHS prior to unit removal or acquisition
- Fax this form to REHS at 732-445-3109 or use the Web version at http://rehs.rutgers.edu/

Please check one of the following:

- [ ] Acquisition of new unit
- [ ] Reactivation of stored/out of use unit
- [ ] Relocation of unit
- [ ] Storage Request – Unit out of use
- [ ] Disposal of Unit:
  - [ ] Sell
  - [ ] Donate
  - [ ] Junk

Common Postings and Labels

This sign will be posted on doors into radioactive material labs. You may also see it on a hood or equipment that may be contaminated.

This label is found on equipment containing radioactive sources such as liquid scintillation counters, gas chromatographs (with ECD’s), etc.

This sticker is posted on all labs that have been deactivated but not fully decommissioned. Any renovation work requires a full decommissioning. Contact REHS prior to painting, removing floor tiles, or removing any fixed equipment.

This signs is posted on lab doors that house radiation producing equipment.

This posting is on all radiation producing equipment.
